South Africa's national accounts: An overview of sources and methods[1)]

1. Introduction

This publication is a guide to the South African national accounts. It reviews the major concepts and definitions, describes the data sources and methods used and outlines the main features of the revised System of National Accounts. Revised annual national accounts data are available for calendar years from 1946 to 1998 and on a quarterly basis from 1960 onwards.

Comprehensive revisions became necessary, mainly

- because a new international System of National Accounts 1993 (1993 SNA) was published in 1993.
- to capture the changes in relative prices and in the structure of the economy it became necessary to revise the constant 1990 price series to a new base year.
- to benchmark estimates at nominal values, incorporating the most recent census results, including the 1996 Population Census and various industry censuses.
- to implement changes on account of revised public-sector data, more up-to-date information about the informal sector's contribution to the economy and minor adjustments to comply with the overall consistency requirements of the accounts.

The sources of information and methods used in compiling the national accounts for South Africa were described in the *Supplement to the Quarterly Bulletin*, June 1991. That information has now been updated and includes, *inter alia*, the way in which the South African System of National Accounts (SASNA) has incorporated the 1993 SNA guidelines. Section 2 of this paper briefly describes the conceptual framework of the South African System of National Accounts, followed in Section 3 by an outline of the structure of the accounts. Section 4 sets out the principal sources of data and methods of calculation. Section 5 gives a theoretical description of the integrated economic accounts as recommended by the 1993 SNA and an example of South Africa's integrated economic accounts. In addition, Sections 6 and 7 outline the accounting framework of the 1993 SNA and briefly summarise the main features of the 1993 SNA, while Section 8 contains some concluding remarks.

2. A conceptual framework of the South African System of National Accounts

2.1 A historical overview

The national accounts are one of the main building blocks of macroeconomic statistics that form a basis for framing economic analysis and policy. The system of national accounts is probably one of the most important products of development of economic statistics or accounting in the twentieth century. If fully developed, the system may be considered a mirror of the modern national economy, which estimates in a quantitative sense the performance of the economy as a whole. In the 1993 SNA the accounts are defined as "a logically consistent and integrated set of macroeconomic accounts, tables and balance sheets which conform to a set of internationally agreed concepts,

---

1) Acknowledgments:

The text of this supplement was written by Messrs J.W. Prinsloo and J.G. van der Walt, Senior Economists in the Economics Department of the Bank. Mr H. Smith, Head National Accounts Division, was responsible for the compilation of the revised national accounts with valuable assistance by Messrs H. Wagner and Z.B. Jansen. Mr J. Redeby led the Statistics South Africa team.

Other staff responsible for significant contributions to the revision and rebasing of South Africa's national accounts are listed below:

Gross domestic product - Mr Z.B. Jansen and Mrs K. Kuhn of the Bank, and Messrs J. Redeby, G. Mills, Mrs M. Gouws and Miss L. van Heerden of Statistics South Africa.

Final consumption expenditure by households - Mrs A.M. Stols.

Gross fixed capital formation and change in inventories - Messrs H. Smith and P.T. Seepi.

General government transactions - Mrs E. Botes.

Current income and expenditure of incorporated business enterprises - Mr Z.B. Jansen and Miss R. Willemse.

Foreign transactions - Messrs S.S. Walters, J.J.H. Erasmus, G.N. Farrell and Mrs M.J. Röder-Steenkamp.

Computer support and graphic services - Mr W.A. Maree, Mmes M.S. Jordaan, A. van Wyk and A. van Heerden, Mlles K. Smit and M.S. Makhetha.

Publications - Mr B.P. Pretorius and Mmes N. Botha, G.F.A. de Jager and R.D. Engelbrecht.

Secretarial and administrative services - Mmes R. Smit, T.H. Mantshimuli and Miss M.E. van Deventer.

definitions, conventions, classification and accounting rules". Using these guidelines, the users and producers of national accounts information in a specific country have to decide on the national accounts framework which is appropriate for the country and how, within that specified framework, information should be compiled.

The history of national accounting can be traced back to the seventeenth century when Sir William Pitty, in 1665, and later Gregory King, in 1688, tried to estimate the national income of England because of their interest in raising revenue and assessing England's war potential. However, it was not until the twentieth century that the basic concepts of national accounting were developed by several economists under the inspiring influence of John Maynard Keynes.

During the Great Depression of the 1930s, when the world was plunged into a deep depression and large-scale unemployment, Keynes propagated the theory that production and employment could be regulated through well-planned policies. Consequently, a need for national accounting had arisen from ambitions to apply the development of macroeconomic theory. In particular, Keynes in "The General Theory of Employment, Interest and Money" emphasised the interrelationships between consumption, savings, investment and monetary flows. Statistics measuring the total production of a country and the other aggregates mentioned, became necessary to test the quantitative relationships between these aggregates and to plan and assess economic performance. To this end, the national income accounts, with an emphasis on the four aggregates of production, consumption, saving and investment, were initiated as a tool for the conduct of economic policy.

Since World War II national accounting practices have become increasingly standardised under the auspices of the United Nations. The need of international organisations for comparable data about their members was an important factor which prompted the development of international standards for national accounting in the late 1940s and early 1950s. The first official manual and system of national accounts were produced by the first expert group on national accounts, convened by the United Nations Statistical Office under the leadership of Richard Stone of the National Accounts Research Unit at Cambridge University. This manual, *A System of National Accounts,* was published in 1953, and it became widely used by government statistical services throughout the world. The SNA was subsequently improved and extended, and in 1968 a revised version was released which included an analysis of input-output tables, the flow-of-funds accounts and a brief description of balance sheets.

Over the last decade, several international institutions and individuals have made a concerted effort to update, classify and simplify the 1968 SNA and to harmonise it with other international statistical standards. In 1993 the revised edition of the international *System of National Accounts 1993* (1993 SNA) was published. The comprehensive document, spread over 760 pages, was prepared under the auspices of the Inter-Secretariat Working Group on National Accounts (ISWGNA), consisting of the Statistical Office of the European Communities (Eurostat), the International Monetary Fund (IMF), the Organisation for Economic Cooperation and Development (OECD), the Statistical Division (Unstat) and regional commissions of the United Nations Secretariat, and the World Bank. Adoption of the 1993 SNA was unanimously recommended to the United Nations Economic and Social Council by members of its Statistical Commission at its twenty-seventh session, held in New York from 22 February to 3 March 1993.

In South Africa, the development of the national accounts dates back to the 1920s when estimates by R.A. Lehfeldt on South Africa's national income for 1917/18 and 1922/23 were published in 1922 and 1925, respectively. In the late 1930s and the beginning of the 1940s, these estimates were followed by the classification of the national income according to kind of economic activity by C.G.W. Schumann, and estimates of gross domestic product and gross investment by S.H. Frankel. However, it was not until 1946/47 that the former Bureau of Census and Statistics started making official estimates of domestic and national income for South Africa. In addition, the South African Reserve Bank in the implementation of monetary policy established a set of annual national accounts in the early 1950s. These estimates from 1946 onwards, were published in the *Quarterly Bulletin* of the Bank. As the demand increased for more up-to-date information on domestic economic developments by the monetary and fiscal institutions for policy formulation and by private-sector analysts, the South African Reserve Bank began the development of national accounts estimates on a quarterly basis in 1960. After extensive research on and development of these aggregates, the Bank published the national accounts on a quarterly basis, dated back to 1960, in the March 1971 issue of the *Quarterly Bulletin.*

After a process of evolution, revision and development, the tables indicated in the box comprising current-price, constant-price and seasonally adjusted time series, are currently published in the *Quarterly Bulletin* of the Bank.

Additions and changes to these tables to accommodate the suggestions of the 1993 SNA and the five-yearly rebasing and revisions are discussed in detail under Notes to Tables in the June 1999 *Quarterly Bulletin* of the Bank. Although the SASNA is generally consistent with the principal guidelines and recommendations contained in the 1993 SNA, there are a number of areas where the SASNA does not fully adhere to the SNA specifications. In general, the differences are encountered where data limitations

prevent the SNA recommendations from being adopted, or where an alternative treatment is considered more appropriate because of South African circumstances. In addition, the degree of disaggregation, or in some cases aggregation of sectors or activities, corresponds with particular economic and statistical realities.

2.2 General concepts of the accounting framework

The identities in the national accounts framework enforce the consistency of the concepts used to describe the different parts of the economic process, such as production, consumption, saving and investment. As a result of this internal consistency, data from different parts of the accounting framework can be usefully related to one another. The system summarises the economic activities of households, businesses, government and the rest of the world. It shows how income which originates in the production of gross domestic product, as adjusted for taxes and transfers, flows to these groups of economic agents and how they allocate these flows between consumption, saving and investment. However, before discussing the structure of the accounts, it is necessary to explain the basic aggregates of the national accounts.

2.2.1 Production as an economic activity

The principal concept in the national accounting system is production. Production can be defined as the process whereby labour, natural resources, capital assets and entrepreneurial skills are applied to the provision of goods and services. These activities are not limited to the production of goods by, *inter alia*, the agricultural, mining or manufacturing sectors, but also include the provision of all kinds of services which either add to the value of goods, for example transport, communication and merchandising services, or are directly bought and sold in the market in their own right – such as professional services as well as other service industries including health, education and the work of civil servants. Consequently, production is not confined solely to the production of goods and services which are clearly of monetary value because they are bought and sold. Some goods and services do not enter the market. They are made available without explicit charges by the individual or organisation producing them, for example most goods and services produced by non-profit institutions or the general government. In addition, goods and services produced for the direct personal use of the producer, such as own final consumption or own gross fixed capital formation, are included in the definition of production.

In general, the goods and services provided by government institutions, excluding public corporations and business enterprises of general government, are not normally sold but are treated as part of production. In practice, they are valued at cost. This comprises the total of wages and salaries paid to the employees of general government institutions and the cost of purchased goods and services. Similar considerations apply to non-profit institutions – examples are clubs, trade unions, churches and other institutions serving businesses such as the Chamber of Mines, whose costs are largely or wholly met by members and benefactors so that the goods and services produced need not be sold at a commercially determined price. The production of non-profit institutions is therefore valued at cost in the national accounts.

One of the principal examples of an economic activity which is not actually exchanged for money but included in production, is the provision of owner-occupied housing. No money passes between the owner and the occupier of a house when they are one and the same person, but the services of the house do nevertheless have a value equivalent to the net income which could be obtained from letting it commercially. In effect, owner-occupiers are regarded as operating businesses; they receive rent from themselves as consumers, pay expenses and make a net contribution to the value of production which accrues to them as owners. This process of inventing a transaction is known as "imputation". Similarly, values are imputed for certain forms of employees' income in kind (such as food and lodging for domestic servants and fringe benefits provided by businesses to their employees) and for farm produce consumed by farmers and their households.

These examples are some of the most important cases of imputation in the national accounts. It should be noted that whenever an income is imputed, a corresponding expenditure must also be recorded. The inclusion in the owner's income of the value of an owner-

occupied house must be balanced by an imputed payment of rent which will be treated as private consumption expenditure. Likewise, the inclusion of free food in the income of domestic servants must be balanced by their imputed expenditure on food. Both aspects of the imputed transaction must be recorded in order to preserve the identity between income, production and expenditure.

As far as household production is concerned, all production of goods in households, whether sold or not, is included within the production boundary. So is production of services if they are supplied to units other than their producers. This implies the incorporation of activities such as the production and processing of agricultural, dairy and fishing products, including the production of butter and cheese on the farm, the preservation of meat, dressmaking and the production of footwear, baskets, mats and pottery. By contrast, personal services for own final consumption within the same household, such as preparing meals, child care, care of the elderly, house-cleaning and transport (except for services produced by employing paid domestic staff), are excluded.

Another issue in the demarcation of the boundary for valuing production for national-accounting purposes is what is called illegal production. Illegal production has always been implicitly contained within the production boundary and in the 1993 SNA this is clearly stated. According to the 1993 SNA, illegal production comprises

- the production of goods and services, the sole distribution or possession of which is forbidden by law; and
- production activities which are usually legal but become illegal when carried out by unauthorised producers, for example unqualified medical practitioners.

Activities which may be illegal but are productive in an economic sense include the manufacturing and distribution of narcotics, illegal transportation such as smuggling, and other services such as prostitution. It has generally been assumed that concealed production and the underground economy fall within the production boundary. There are no reliable statistics available on the well-known illegal activities, but estimates of the value added by the informal sector are incorporated into the official gross domestic product estimates for South Africa.

2.2.2 The concept of gross domestic product

Gross domestic product is the main concept in current use for measuring aggregate economic activity in South Africa during a given period. In measuring such activity, care should be taken to avoid double counting. Enterprises buy goods and services for use in their own production process. If the value of all goods and services produced were added together there would be substantial duplication because some activities would be counted several times at successive stages of production. In the national accounts, however, it is only the value added in production which is important. Therefore, the concept of gross domestic product (GDP) can be defined as the unduplicated value of gross production originating within the boundaries of South Africa, independent of whether the factors of production (such as labour and capital) are provided by residents or foreigners.

In the 1993 SNA, the preferred method of valuation of output of goods and services produced for the market is at basic prices, especially when a system of value-added tax (VAT) is in operation. The definition of basic prices given in the *European System of Accounts* or *ESA 1995* (published by Eurostat, Brussels, 1996), which is more descriptive than that in the 1993 SNA, reads as follows: "The basic price is the price receivable by the producers from the purchaser for a unit of a good or service produced as output minus any tax payable on that unit as a consequence of its production or sale (i.e. taxes on products) plus any subsidy receivable on that unit as a consequence of its production or sale (i.e. subsidies on products). It excludes any transport charges by the producer on the same invoice, even when they are included as a separate item on the invoice."

The 1993 SNA states further: "When output is recorded at basic prices, any tax on the product actually payable is treated as if it were paid by the purchaser directly to the government instead of being an integral part of the price paid to the producer. Conversely, any subsidy on the product is treated as if it were received directly by the purchaser and not the producer." The SASNA incorporated the recommended basic price concept in the valuation of goods and services during the revisions to establish the 1995 benchmark estimates. Basic prices are important since they reflect the amount received by the producer for a further unit of a good or service produced, and therefore help to direct the allocation of productive resources. In addition, the SASNA will continue to calculate gross value added at factor cost. Although the concept of gross value added at factor cost is not explicitly used in the 1993 SNA, it can be derived by subtracting the value of non-product-linked taxes less subsidies on production, from gross value added at basic prices. As gross value added at factor cost is essentially a measure of income and not output, the concept of factor income is no longer used in the system. However, gross value added at factor cost can be interpreted as measuring the value of the funds from which "factor incomes" can be paid, namely the remuneration of employees and gross operating surpluses, which implies that gross value added is equal to the total value of the "factor" incomes generated by production.

In addition, the gross domestic product can also be measured by considering the expenditure of those who purchase the final goods and services. When using this method, it is essential to exclude the transactions that occur when a commodity or a service is bought to be used up in producing a further "downstream" product. It is necessary to draw a distinction between

"intermediate" and "final" purchases. Final goods also comprise capital goods, such as buildings and construction works, plant and machinery and transport equipment. Expenditure on these goods is regarded as final expenditure. Furthermore, some goods which have been produced may not be sold or used immediately in the productive process. These goods, which are added to inventories, as well as additions to work-in-progress between the beginning and the end of an accounting period, are also accounted for as final expenditure and represent investment by the holder of inventories. Finally, all sales to non-residents – exports of goods and services – are final sales. Consequently, total final expenditure can be defined as the sum of final expenditure by residents, which is equal to aggregate gross domestic expenditure, plus exports of goods and services. However, many of the final goods and services contain imported materials and their values consist of the total value of imported goods and services plus the value added in domestic production. Gross domestic product is therefore equal to final expenditure less imports of goods and services. This is equal to aggregate gross domestic expenditure plus exports of goods and services minus imports of goods and services. When measured in this way, the result is called expenditure on gross domestic product at market prices, reflecting the expenditure method of calculating gross domestic product.

To complete the identity within the national accounts between production, income and expenditure, gross value added at basic prices and factor cost have to be adjusted as follows to be equal to gross domestic product (GDP) at market prices:

Gross domestic product at market prices
= Gross value added at basic prices *plus* taxes, *less* subsidies on products

or

Gross domestic product at market prices
= Gross value added at factor cost *plus* taxes, *less* subsidies on products and production.

The use of "gross" in the GDP estimates indicates that no deduction has been made for consumption of fixed capital (depreciation). This implies that the gradual deterioration of the economy's productive assets is not accounted for in estimating the gross domestic product. An estimate of a country's production net of capital consumed (i.e. net domestic product) would recognise capital consumption as a necessary cost of producing the economy's goods and services and would therefore be a purer measure of production. However, because of the difficulties involved in measuring capital consumption and the variations in the methods used between countries, gross domestic product has remained the major summary measure of economic activity.

2.2.3 Gross national income

Another important concept used in the national accounts of South Africa is gross national income (GNI) which is identical to gross national product, a concept more generally used in the national accounts. However, conceptually GNI measures income and not production. Gross national income (at market prices) is calculated by adding to gross domestic product at market prices, the primary income receivable by resident units from the rest of the world minus the primary income payable by resident units to non-resident units. The concept of primary income replaces factor payments and receipts hitherto used in the SASNA (for more information on primary income, see the discussion in Section 5 of the Integrated Economic Accounts on the primary income account).

2.2.4 Gross national disposable income

An alternative measure of income which is widely recognised and used, is that of national disposable income. This is equal to gross national income at market prices minus current transfers (which include social contributions, current taxes on income and wealth and other current transfers) payable to non-resident units, plus current transfers receivable by resident units from the rest of the world. As this identity is equal to total domestic expenditure plus net investment abroad, it may be interpreted as the nation's claim over goods and services – whereas net investment abroad comprises that which could be converted into imports and hence additional inventories and/or consumption. If it is negative it may be equated with the foreign borrowing required to finance the imports which support the given level of domestic expenditure.

2.2.5 Gross national expenditure

Given the concept of gross national and disposable income derived from production as described in the previous sections, it is also useful to consider how this income can be spent.

In considering the composition of national expenditure it should be noted that transfers abroad are a key element of national expenditure. Net transfers abroad can reduce or, if receipts exceed payments, increase the country's claim on goods and services. Apart from expenditure on international transfers, national expenditure can be divided into consumption and investment. Consumption in principle comprises final expenditure by individual consumers and general government on goods and services which are consumed within a short time of purchase. However, in practice it also includes outlays on durable consumer goods.

In the case of investment, the expenditure reflects the net increase in the stock of capital assets, both physical and financial. Physical assets refer to capital goods such as buildings, construction works, machinery and transport equipment and inventories – including work-in-progress. In addition, financial assets

comprise holdings of securities and other claims including currency and bank deposits. However, every financial asset or claim is necessarily a liability to someone else – and for the resident units, financial assets must be offset exactly by financial liabilities. An increase in investment by the nation as a whole therefore means a net addition to the nation's stock of physical assets together with any net addition to the total claims by resident units on non-resident units, in forms such as gold, foreign exchange, holdings of shares in non-resident enterprises or trade credits.

In summary, national expenditure therefore comprises

- net transfers abroad;
- aggregate gross domestic expenditure; and
- net investment abroad.

This aggregate value of national income is equal to the aggregate value of expenditure by which it is generated. The latter can be expressed as

- aggregate gross domestic expenditure;
- net exports of goods and services; and
- net primary income from abroad.

In addition, the accounting identity of the balance of payments requires that

- net exports;
- *plus* net primary income from abroad, *should equal*
- net transfers abroad;
- *plus* net investment abroad.

Another concept often used in the analysis of economic developments is gross domestic final demand which is the sum of the consumption expenditure of households and general government and gross domestic fixed capital formation. It is also equivalent to gross domestic expenditure less the change in inventories and the statistical discrepancy.

2.2.6 *Other concepts and aggregates*

Several other concepts and aggregates which are essential for compiling and analysing national accounts data are briefly described in the following paragraphs.

2.2.6.1 Classification

In general, macroeconomic statistics record economic transactions. An economic transaction occurs when ownership of a real or financial asset is transferred, or a service is rendered, by one party to another. Consequently, a set of national accounts is built around a sequence of interconnected flow accounts which are linked to different types of economic activity taking place within a given period of time. In addition, these accounts are linked to balance sheets which record the values of stocks of assets and liabilities held by institutional sectors.

Flows are classified in four categories, namely production, consumption, accumulation and transactions with the rest of the world. Flows are recorded in four main sets of accounts. These accounts traditionally comprise

- the gross domestic product and expenditure account;
- national disposable income and its appropriation accounts;
- capital finance accounts; and
- the rest of the world account.

In the 1993 SNA these activities are recorded in the core accounts of the System, grouped into a set of integrated economic accounts[2] consisting of three basic categories, namely current accounts, accumulation accounts and balance sheets. However, to judge the economic behaviour of resident units, it is necessary to record all transactions between resident and non-resident units. These transactions are grouped together in one account, namely the rest of the world account.

The different *current accounts* dealing with production, distribution of income and use of income are

- the production account, which records the production (output) of goods and services; and
- the distribution and use of income accounts, which consist of four main accounts, displaying the process of distribution and use of income.

The *accumulation accounts* represent flow accounts which record all changes in assets, liabilities and net worth, while the *balance sheets* show the values of the stocks of assets and liabilities held by institutional units or sectors at the beginning and end of an accounting period.

The flows in these accounts are based on the principles of double-entry bookkeeping. Every transaction appears once in the account of the payer and once in the account of the recipient of the payment concerned. This enables the compilers of the national accounts to establish important linkages in the System. In this way, flows of goods and services can be traced through the economic system from their producers to their eventual users. Likewise, the accounts of the System are designed to provide analytically useful information about the behaviour of institutional units and the activities in which they engage, such as production, consumption and the accumulation of assets.

The entries in the four main accounts represent aggregate totals of numerous individual transactions carried out by various kinds of transactors, classified according to various kinds of economic activities. Transactors are normally grouped according to the following approaches: firstly, transactors are classified according to the general nature of their activities, which may involve either production or consumption and accumulation (or saving; see Table 1, for an institutional classification of the four sectors and the units included per sector that participate in these activities). Secondly, in a further classification, transactors are categorised according to the kinds of goods produced or services rendered (i.e. by kind of economic activity). The industry or economic activity breakdown generally uses the first digit level of

2) See Section 5 "The integrated economic accounts".

the *Standard Industrial Classification of all Economic Activities,* which is in congruence with the *International Standard Industrial Classification of all Economic Activities* (third edition; ISIC Rev.3). Table 2 outlines the categories according to this classification, adapted to South African economic circumstances.

Table 1.
Classification of institutional sectors

1. Non-financial enterprises
   - Public companies
   - Private companies
   - Close corporations
   - Public corporations
   - Quasi-companies

2. Financial enterprises
   - Central bank
   - Other depository enterprises
   - Other financial intermediaries, including insurance companies and pension funds

3. General government
   - Central government
   - Provincial government
   - Local authorities
   - Extra-budgetary institutions
   - Business enterprises of general government

4. Households

   - Households as consumers
   - Unincorporated enterprises and informal business activities owned by households
   - Non-profit institutions serving households (NPISHs)

Table 2.
Classification of value added by kind of economic activity

1. Primary
   - Agriculture, hunting, forestry and fishing
   - Mining and quarrying

2. Secondary
   - Manufacturing
   - Electricity, gas and water
   - Construction

3. Tertiary
   - Wholesale and retail trade and catering and accommodation
   - Transport, storage and communication
   - Financial intermediation, insurance, real estate and business services
   - Community, social and personal services

Other classifications made in the system of national accounts include private consumption expenditure according to the purpose and according to type of expenditure, and fixed investment by type of asset.

The classification and sectoring of activities through the system of national accounts enhance the usefulness of the accounts for purposes of economic analysis. Information is often needed on a sectoral or subsectoral basis in order to target or monitor particular groups of institutional units for policy purposes. Likewise, other classifications or subdivisions of institutions' spending patterns make it possible to assess how effective the process of economic development, or government economic and social policy measures are.

2.2.6.2 Time of recording

With regard to timing, the system records flows on an accrual basis; that is, at the time an obligation or a liability arises rather than when it is settled. These transactions are generally recorded at the moment when purchases are made and legal possession of the item is taken, irrespective of delays in the payment for the delivery of goods or services concerned.

According to these guidelines, output is recorded when it is produced, not when paid for by a purchaser, and the sale of an asset is recorded when the asset changes hands, not when the corresponding payment is made. Interest is recorded in the accounting period when it accrues, regardless of whether or not it is actually paid in that period. In the case of a hire-purchase agreement, the purchase of the article (the expenditure) concerned is considered to have taken place at the time when the hire-purchase contract was signed.

When machinery and equipment are produced on order, the eventual buyers are assumed to take ownership of the goods concerned at the time when the manufacturing of these goods has been completed. "Progress payments" for orders in the process of being executed are entered in the capital finance account as advances to the manufacturers. In the case of construction of buildings and other construction works, however, the buyers are considered to take possession progressively and on a running basis of all work done up to the final completion of the entire building or construction project.

However, in some cases it is necessary to show flexibility in the time of recording. This applies generally to flows concerning general government which are mostly recorded on a cash basis in the government accounts. It is sometimes difficult to carry out an exact transformation of these flows from a cash basis to an accrual basis. In these cases it might therefore be necessary to use approximations.

Although cash accounting may have a practical advantage in so far as it avoids the problems connected with the valuing of non-monetary flows, it cannot be used generally for national accounting as the times when payments take place may diverge significantly

from the economic activities and transactions to which they relate and it is these underlying activities and transactions that the System attempts to capture.

2.2.6.3 Seasonally adjusted estimates

In the compilation and analysis of quarterly estimates it is important to note that most national accounts series show a distinct seasonal pattern. Normally the quarter-to-quarter movements in the unadjusted estimates are dominated by large seasonal fluctuations exhibiting similar patterns from one year to the next, which are of little interest in themselves and tend to mask underlying non-seasonal trends.

Seasonal fluctuations in national accounts data arise from factors and events that occur regularly, and mostly at fairly fixed times or within fairly fixed periods, in the course of successive calendar years. Examples of such regularly recurring annual events are seasonal changes in weather conditions, public holidays, festive, seasonal and school vacations; such events are normally accompanied by changes in people's production and consumption activities.

To assist users, these seasonal influences have to be removed from the national accounts time series data to help isolate the underlying trends. This is done through a statistical technique known as seasonal adjustment.

The seasonal adjustment of time series is complicated by the fact that seasonal factors do not usually occur with complete regularity and with fully unchangeable, absolute or relative strength from year to year. Secondly, the patterns of seasonal variation may themselves shift over time. Among the non-man-made causes of seasonal fluctuations, the seasonal changes in, for example, weather conditions – such as the onset of summer rains or winter frosts – may vary "randomly" quite substantially and largely unpredictably from one year to the next. This may, for example, cause the harvesting of the South African maize crop to shift from "early" (i.e. mostly in the second quarter) in any one calendar year, to "late" (i.e. mostly in the third quarter) in the ensuing year. Among the man-made causes of seasonal fluctuations, new public holidays may be proclaimed, or new school holiday periods instituted. Changes in customs and conventions (or in legislation) may give rise to new patterns of seasonal variation. Consequently, it is not possible to devise an incontestable set of seasonally adjusted figures: the estimates depend on the methods used and are to some extent subjective. The estimates for the latest quarters are particularly uncertain as the seasonal adjustment has to be based on experience in previous years and the pattern of seasonal variation may be changing.

The calculation of seasonal adjustments is undertaken using the X-11 program which was originally developed by the United States Bureau for the Census. There are two alternative versions of this model, one multiplicative and the other additive. The method involves the application of moving averages to estimate the specific components, with special treatment for outliers and foreseeable trading-days. It allows for changing seasonal patterns. The multiplicative model is the more appropriate for most national accounts series, although in a few cases, such as for time series which switch sign, the additive model must be employed.

For the national accounts in general, seasonal adjustments are calculated for component series, in as fine detail as is judged appropriate. The published seasonally adjusted totals are the sums of the seasonally adjusted components. In addition, the seasonally adjusted estimates for the quarters of each year are constrained to add up to the total of the unadjusted estimates for the year. This procedure ensures that the quarterly accounts balance in the same way as the annual ones.

2.2.6.4 Inventory valuation adjustment

The methods of inventory valuation obtained from business accounting records vary and are often different from those required for the compilation of national accounts. Changes in inventories calculated from the book values of an institution reflect the prices recorded in the company's financial accounts, which in turn depend on the accounting conventions adopted. However, in the national accounts, inventory changes have to be measured in terms of the average market price prevailing in the accounting period, and recorded book values should be adjusted accordingly.

In practice, many businesses use the accounting convention called historic cost measurement, whereby inventories are valued at the lower of either cost or market prices. Thus, at the beginning of a period inventories are valued at cost or the current prices prevailing, whereas end-of-period inventories are valued at cost or the prices prevailing at that particular time. In periods of rising prices, the book value of inventories will frequently display an element of capital gain (even if there has been no change in the volume of inventories held), which implies that inventories at the beginning of a period and withdrawals have been recorded at original cost, but purchases and inventories at the end of the period are recorded at a higher price. Likewise, if prices are falling, the book value of inventories will display an element of capital loss even if there is no change in the quantity of inventories at hand. Therefore, during times of an increase in prices, the change in the book value of inventories measured on a historical cost basis will include both the value of the physical changes in inventories and an increase in value due to the effect of rising prices on the value of inventories held. As a result, a capital gain (or loss, if prices are falling) arises, which should be excluded from the book value for national accounting purposes.

The methodology for calculating these adjustments comprises revaluing the reported figures of inventories at the beginning and end of a quarter, i.e. the book values of inventories, to reflect constant price levels. The difference between the revalued figures for inventories at the end and the beginning of the quarter measures the

physical change in inventories for that quarter. This physical change is again revalued at an average price for the quarter. The difference between the revalued changes in inventories and the changes in book values represents the "inventory valuation adjustment". As the initial estimates of the gross operating surpluses of business enterprises and saving incorporate the effect of the value of inventories derived on a historical cost basis, the element of holding gain is also excluded from income and saving by way of the inventory valuation adjustment.

The current methodology underlying the revaluation of inventories in South Africa is based on the assumption that businesses generally value their inventories on a historical cost, FIFO (First in, first out) basis.

2.2.6.5 Consumption of fixed capital

The consumption of fixed capital may be defined as that part of the gross product which is required to replace fixed capital consumed in the production process during an accounting period. It is the amount which needs to be set aside to maintain the existing capital intact. This flow is based on the concept of the expected economic life of an asset and is designed to cover the loss in value due to normal wear and tear and foreseeable obsolescence, including a provision for losses of fixed assets as a result of accidental damage which can be insured against. Unforeseen losses, as in the case of major natural or man-made disaster (e.g. war) are treated as capital losses rather than consumption of fixed capital. No allowances are made at present for the depletion of natural resources, such as reserves of gold, gas and other minerals.

Consumption of fixed capital should in principle be calculated for all categories of fixed investment, including tangible fixed assets and intangible fixed assets such as mineral exploration costs and computer software. Where appropriate, depreciation allowances should also be calculated for infrastructural works such as roads and other assets previously treated as having infinite service lives. Although certain structures such as roads, dams, bridges and railway lines may appear to have infinite lives if properly maintained, it is also true that the value of assets may decline not only because they deteriorate physically, but also because of reduced demand for their services as a result of technical progress and the availability of new substitutes.

Provision for the consumption of fixed capital is shown at current replacement cost in the national income and expenditure accounts. This should be distinguished from the depreciation allowed for tax purposes that is normally used in business accounts. The "depreciation" in business accounts is often based on the historical cost of the assets – in this way provision is made for setting aside the original monetary outlay during the lifetime of each asset. By contrast, for measuring national income and expenditure, the current charge for the use of assets should be based on current prices - the prices which also apply to other transactions in the national accounts. Consequently, the consumption of fixed capital takes into account the cost of replacing the assets in the period for which the estimates are being made. In addition, this figure should be estimated on the basis of the stock of fixed assets and the probable average economic life of the different categories of assets. Estimates of capital consumption and the capital stock at constant prices are converted to replacement values by multiplying the constant-price magnitudes by an appropriate price index.

For the calculation of the stock of fixed assets, the perpetual inventory method (PIM) is recommended if direct information is not available about the stock of fixed assets. The PIM used for estimating the gross capital stock consists of an accumulation of past flows of gross fixed capital expenditure, after the deduction of the estimated value of retirements from the stocks. This step includes assumptions about the economic life span of different types of assets.

Consumption of fixed capital is calculated according to the "straight line method", by which the value of a fixed asset is written off at a constant rate over the whole lifetime of the item. This method is in accordance with international guidelines. However, uncertainty about asset lives is one of the principal problems in applying the PIM. In theory, the asset lifetimes used in the PIM should be the expected economic lifetime of an asset which is designed to cover the loss in value due to normal wear and tear (physically worn out) and expected obsolescence due to technical progress or other economic factors. It is also intended that the average life of an asset should take into account any irreparable accidental damage. The current estimates of economic lifetimes for the different types of assets in South Africa vary between a maximum of 80 years for construction works in the agricultural and the general government sectors and a minimum of 8 years for transport equipment (see Table 3).

Table 3. The economic lifetime according to type of asset

Type of asset	Sector	Lifetime years
Residential buildings		50
Non-residential buildings		50
Construction works	Agriculture	80
	Mining	30
	General government*	80
	Other	50
Transport equipment		8
Machinery and other equipment	Manufacturing	8
	Mining and electricity, gas and water	16
	Other	10

* Including roads, dams and bridges.

2.2.6.6 Financial intermediation services indirectly measured (FISIM)

Another important and rather difficult concept specifically dealt with in the 1993 SNA is the financial intermediation services provided by financial intermediaries, excluding insurance corporations and pension funds. Financial intermediaries include almost all institutions known as "banks". Because financial intermediation is inherently different from most other types of productive activity, the 1993 SNA deals with the output of financial intermediaries, namely "financial intermediation services indirectly measured" (FISIM) in more detail than the 1968 SNA. In general, monetary and financial institutions provide a variety of services. Some are specifically charged for, such as commissions and charges on cheques; the corresponding revenues form part of their output. An additional and highly significant output of these institutions is the imputed services (or FISIM) which are not explicitly charged for. These basically arise because the interest rates charged on bank loans are higher than those paid on deposits with banks. This difference is translated into net revenue for the banks, which is indirectly paid for by lenders and depositors.

In the 1993 SNA the output of FISIM is measured in the same way as in the 1968 SNA, i.e. the total property income (e.g. interest) receivable by financial intermediaries less their total interest payable, excluding the value of any property income receivable from the investment of their own funds, as such income does not arise from financial intermediation. However, contrary to the 1968 SNA, the 1993 SNA in principle recommends that the consumption of these services be allocated among users, who could be lenders as well as borrowers, and that the allocated amounts be treated either as intermediate consumption by enterprises, as final consumption or as exports. In practice, however, it may be difficult to find a method of allocating financial intermediation services indirectly measured among different users in a way which is conceptually satisfactory from an economic perspective and for which the requisite data are also available. Therefore, the 1993 SNA accepts that some countries may prefer to continue using the convention proposed in the 1968 SNA whereby all the services are allocated to the intermediate consumption of a notional industry.

2.2.6.7 Final consumption expenditure and actual final consumption

A further development in the 1993 SNA is the specification of the interrelationship between *final consumption expenditure* and *actual final consumption.*

Final consumption expenditure is a concept that refers to a sector's expenditure on consumption goods and services. By contrast, actual final consumption refers to a sector's acquisition of consumption goods and services. Basically, the difference between these concepts lies in the treatment of certain goods and services financed by the government or non-profit institutions serving households (NPISHs) but supplied to households as social transfers in kind. The actual final consumption concept distinguishes between individual consumption and collective consumption (see Section 3.3.2.1 for a detailed description of individual and collective consumption).

Actual final consumption of households, for example, covers goods and services which are supplied to households, irrespective of whether these goods and services are actually paid for by government, NPISHs or households themselves. Consequently, actual final consumption of households is measured by the value of all the individual consumption of goods and services acquired by resident households and consists of

- final consumption expenditure by households;
- those goods and services acquired by households as social transfers in kind from NPISHs; and
- those acquired as social transfers in kind from general government – i.e. government expenditure on individual consumption goods and services such as education, health and welfare.

Actual final consumption of households, allowing for these social transfers in kind, is regarded a better indicator of living standards than final consumption expenditure alone.

The value of actual final consumption by general government is measured as the outlays on the collective consumption provided to the community. NPISHs have no actual final consumption. Their final consumption expenditure is treated as individual consumption and, therefore, included in actual consumption by households.

For households, the imputed transfers received from general government and/or NPISHs are added to disposable income to obtain the concept of adjusted disposable income for households. In the case of government and NPISHs, the transfers are deducted from final consumption expenditure.

These adjustments in consumption would aid the international compatibility of data on household consumption, but a reliable implementation of this change would require a detailed functional distribution of expenditure by general government on an SNA basis. It should be emphasised that actual final consumption for the economy as a whole is exactly equal to final consumption expenditure, while saving by each institutional sector also remains unchanged on account of these adjustments.

2.2.6.8 Constant price estimates

An important consideration when evaluating the changes in production, income and expenditure between accounting periods, is to what extent the changes are "real" and how far they are the result of inflation. In order to distinguish between changes in prices and changes in quantities, all flows in the production account are estimated at both current and constant prices.

There are basically two approaches which can be used to estimate time series at constant price values. In

the first place, the estimate of quantity in each period is multiplied by the base year price. This method is mainly applied if the commodity is defined narrowly enough to ensure that it is homogeneous in content and does not change in quality over time. In some instances, particularly in the case of services industries, data constraints lead to the use of a proxy quantity time series in the absence of availability of exact quantity indicators for the current price series being revalued.

The second approach to calculating constant price estimates is referred to as price deflation. A measure of the price component of the nominal value series is obtained, which is usually a relevant price index. This measure is divided into the current price value of the appropriate time series to obtain the volume component, or constant price value. This is the most commonly used method, largely because most macroeconomic statistics are available only as rand values. When an appropriate price index is not available to deflate the current price value of a commodity, it is often revalued using the implicit price deflator of related commodities which have already been revalued. An implicit price deflator is derived by dividing the estimated current price value of a specific commodity by the corresponding estimate of the constant price value.

The 1993 SNA introduces the concept of net national disposable income to measure real income for the total economy. Basically, there is a conceptual difference between gross domestic product at constant prices and real gross domestic income. Gross domestic product at constant prices is essentially a measure of output volume. However, total real income which residents receive from domestic production depends also on the rate at which exports may be traded against imports from the rest of the world. This is subject to the movement in import prices relative to export prices – called the terms of trade change. Therefore an improvement in the terms of trade makes it possible for residents to increase the volume of imports out of the income generated by a given level of domestic production. Real gross domestic income can also be described as measuring the purchasing power of total income generated by domestic production. The difference between the change in the gross domestic product at constant prices and real gross domestic income is generally described as the "trading gain/loss".

The link between the gross domestic product at constant prices and real net national disposable income can be summarised as in the accompanying box.

The treatment of real net national disposable income in the set of national accounts of South Africa, is currently in line with the suggestions recorded in the 1993 SNA.

Changes in price and volume measurements are treated in detail in the 1993 SNA. In principle it recommends variable-weight chain-linking as a standard practice for calculating flows at constant prices. The use of weights derived from annually updated base years will help to reduce the problem of substitution bias experienced if using five-yearly base-weighted estimates. There is, however, a flexibility in the 1993 SNA regarding the choice of methodology to calculate gross domestic product and other aggregates at constant prices. Although the new System prefers the annual volume-chain index for gross domestic product as the measure of changes in the volume of gross domestic product, it acknowledges that Laspeyres volume indices on a fixed base year should also be calculated so that additively consistent time series of values at the constant prices of the base year can also be shown. The base year of such Laspeyres volume indices must nevertheless be changed approximately every five years.

Link between the real gross domestic product and real net national disposable income

Gross domestic product at constant prices

plus the trading gain or loss resulting from changes in terms of trade
plus real primary income receivable from abroad
minus real primary income payable abroad
***equals* real gross national income**
plus real current transfers receivable from abroad
minus real current transfers payable abroad
***equals* real gross national disposable income**
minus consumption of fixed capital at constant prices
***equals* real net national disposable income**

South Africa's national accounts at constant prices are currently based on fixed-weight volume and price indices, and rebasing is done every five years. This practice will be used until further research is thoroughly established regarding the practical implementation and the development of the infrastructure to calculate chain-linked estimates of real gross domestic product estimates.

2.2.6.9 Input-output tables

Input-output tables have become a vital part of the national accounting system. They incorporate the product and expenditure accounts which indeed form the cornerstone of the system of national accounts. The input-output tables contain considerably more information than the product and expenditure accounts because the tables present intermediate transactions, together with the flows of goods and services to final demand, and the incomes generated within a framework which records all transactions among the industries distinguished in the table. Overall, the input-output table also serves as a means for achieving consistency and indicates statistical shortcomings which should be eliminated. In addition, it is an independent benchmark of the entire production account.

The South African input-output tables are compiled by Statistics South Africa and published at regular intervals. To date, Statistics South Africa has published tables for the

years 1967, 1971, 1975, 1978, 1981, 1984 and 1989, and for 1993 a provisional table, based on the RAS method.

2.2.6.10 Supply and use tables

As part of the input-output framework, the supply and use tables are an integrated part of the System of National Accounts. The tables are matrices (rows of products and columns of industries) that show how the output of industries is broken down by type of products and how the domestic and imported supply of goods and services is allocated to various intermediate or final uses, including exports.

In a co-ordinating role, the supply and use tables incorporate the integration of the three major compilation methods of the gross domestic product, namely the production, expenditure and income approaches. Furthermore, the supply and use tables can serve both statistical and analytical purposes by identifying gaps and inconsistencies in basic source data, checking and improving the consistency, plausibility and completeness of figures in the supply and use tables and integrating these tables into macroeconomic policy and forecasting models.

The major conceptual difference between an input-output table and a combined supply and use table is that in the supply and use table, the data relate products to industries whereas in the input-output table, the statistics relate products to products or industries to industries. Therefore, in an input-output table either a product or an industry classification is used for rows as well as columns. As is the case with the input-output tables, the responsibility for the compilation of the supply and use tables lies with Statistics South Africa.

2.2.6.11 Flow of funds

In addition to measuring the production of goods and services and the links with the income and expenditure of the various sectors of the economy, the national financial account or the flow-of-funds account provides information about financial activity in the economy. It is a "national" account because it is part of the integrated system of national economic accounts which covers all sectors of the economy. The purpose of flow-of-funds accounts is to provide a basis for the analysis of sectoral saving flows and investment behaviour, the relationship between the financial and "real" sides of the economy, and inter-institutional financial claims.

In terms of the 1993 SNA, the national accounts are structured in three subsets: the *current accounts* (consisting of the *production account*, the *distribution* and *use of income accounts* and the *rest of the world account), accumulation accounts* (consisting of the *capital finance account*, the *financial account* and the *other changes in assets account*) and *balance sheets*. These accounts have been designed to provide analytically useful information about the behaviour of institutional units in the economy and the activities in which they are engaged, such as production, consumption and the accumulation of assets.

As previously discussed, the national income and product accounts relate to production, consumption and investment. In South Africa, three types of accounts are compiled, namely the product account, income and outlay accounts and the capital finance account. The capital finance account forms the link between the "real" and "financial" flows in the economy. If net saving and capital transfers are not sufficient to cover or are more than sufficient to cover the net accumulation of non-financial assets, the resulting deficit or surplus, referred to as net borrowing or net lending, is the balancing item that is carried forward from the capital finance account to the financial account where it is shown as the financing balance.

The financial account records transactions that involve financial assets and liabilities and that take place between institutional units, and between institutional units and the rest of the world. The account does not have a balancing item which is carried forward to another account, but the net balance of the financial account, i.e. the financial investment balance, is equal in magnitude (but with opposite sign) to the balancing item on the capital finance account, i.e. the financing balance.

The financial account indicates how deficit, or net borrowing, sectors obtain the necessary financial resources by incurring liabilities or reducing assets, and how the net

Consolidated capital finance account for all sectors

Uses of funds	R billions	Sources of funds	R billions
Increase in inventories[1]	-4	Consumption of fixed capital[1]	79
Gross fixed capital formation[1]	103	Saving[1]	11
		Net borrowing from the rest of the world[2]	9
Net lending to the rest of the world[2]	0	Net capital transfers from the rest of the world[2]	0
Gross capital formation	99	Financing of gross capital formation	99
Net acquisition of domestic financial assets[3]	296	Net issue of liabilities to domestic sectors[3]	296
Net acquisition of foreign assets	55	Net issue of liabilities to foreigners	64
Net borrowing from the rest of the world[4]	9	Net lending to the rest of the world[4]	0
Total uses of funds	**360**	**Total sources of funds**	**360**

1. From the national income and product accounts.
2. From the balance of payments.
3. On consolidation, financial claims among domestic sectors cancel out and only assets and liabilities *vis-à-vis* the rest of the world remain.
4. The total of the net inflow of capital and the decrease in gold and other foreign reserves, i.e. the contra item of the balance of payments on the current account.

lending sectors allocate their surpluses by acquiring assets or reducing liabilities. Acquisitions of financial assets and the incurring of liabilities are referred to respectively as "uses of funds" and "sources of funds" in the financial account. The accompanying table shows an example of the link between the financial account and the income and product accounts. (For a more detailed discussion of the national financial account, see "South Africa's national financial account 1970-1992", Supplement to the South African Reserve Bank, *Quarterly Bulletin*, December 1994.)

2.2.6.12 Balance sheets

The 1968 SNA did not develop guidelines for the national and sectoral balance sheets. Such guidelines were developed later and published as *Provisional international guidelines on the national and sectoral balance sheets and reconciliation accounts of the System of National Accounts,* Series M, No 60, United Nations, New York, 1977.

The 1993 SNA integrates the balance sheets into the overall System. If implemented, the balance sheet completes the sequence of accounts, showing the ultimate result of the entries in the production, distribution and use of income, and accumulation accounts. For an institutional unit or sector, the balance sheet provides an indicator of economic status or net worth. Net worth is defined as the value of all the assets owned by an institutional unit or sector, less the value of all its outstanding liabilities. For the economy as a whole, the balance sheet shows what is often referred to as national wealth – the sum of non-financial assets and net claims on the rest of the world. Although full balance sheets are not currently compiled for the South African economy, this area provides a window of opportunity for further research and development.

3. The structure of the accounts

3.1 Introduction

The basic function of the national accounts is to provide a systematic and comprehensive record of national economic activity. The structure of the national income and production accounts provides an economically meaningful summary of the wide range of economic transactions occurring in the economy and the various entities or transactors involved in those transactions.

The starting point for the national income and product accounts is the identity linking the output produced, income generated and the use of that output. In this process the gross domestic product can be classified as the most important aggregate or indicator for the purpose of economic analysis and comparisons over time. It measures total domestic economic activity and can be defined in three different ways:

- The gross domestic product is the sum of all gross value added by the institutional sectors or the industries plus taxes less subsidies on products (Production method).
- The gross domestic product is the sum of the final uses of goods and services by resident institutional units plus the exports of goods and services purchased by foreigners, minus imports of goods and services (Expenditure method).
- The gross domestic product is the sum of factor income paid by resident producers, comprising compensation of employees, gross operating surplus (including mixed income[3]) plus taxes on production and imports, less subsidies (Income method).

By using all three methods, as far as possible, in the calculation of the gross domestic product, and given the fact that independent sources of information are used, estimates do not rely solely on one method and therefore the compilers of the national accounts can be more confident of the soundness of the overall estimation process.

As outlined in the framework above, the different approaches to estimating the gross domestic product provide an analysis of the different component parts and these approaches also give different perspectives on the data. These approaches, with their separate sources and an outline of the accounts, are described in more detail in the following paragraphs.

3.2 The national income and product accounts

The national income and product accounts give a summary of production, expenditure and saving activities in an economy. The production account deals specifically with the supply and use of (demand for) final goods and services. The *supply* of final goods and services is shown on the "supply" or production side of the account and is equal to the sum of the output or production of resident producers and imports. (Imports are shown as a negative total on the expenditure side.) Disaggregations of the totals on this side of the account are shown in the tables on gross domestic product by kind of economic activity and are further detailed in the input-output tables. The *final* uses of goods and services, which consist of final consumption expenditure, gross capital formation and exports, are shown on the "final uses" (expenditure) side of the account. Disaggregations are provided for consumption expenditure, gross capital formation and exports. The production account reflects the three approaches to the estimation of the gross domestic product (GDP), namely the production method, the income method and the expenditure method.

---

3) Income earned by non-incorporated business enterprises owned by households.

3.2.1 The production method

In accordance with the production method (or output approach), the gross domestic product GDP(P) is determined as the sum of production of each economic unit, calculated as

- gross value at basic prices of total output *less* the value of the input utilised in the production process (intermediate input).

The sum of gross value added GDP(P) *plus* taxes *less* subsidies on products for all producers is GDP at market prices.

3.2.2 The income method

In this method of calculation, the gross domestic product GDP(I) is the sum of all income earned by resident individuals or corporations in the production of goods and services and is therefore the sum of uses in the generation of income account (see Section 5: The integrated economic accounts) for the total economy.

In South Africa the income method estimate of gross domestic product, GDP(I) at market prices, is calculated by summing together:

- remuneration of employees (wages and salaries and employers' social contributions);
- gross operating surplus (including mixed income and consumption of fixed capital); and
- taxes on production and imports, net of subsidies.

3.2.3 The expenditure method

The expenditure on gross domestic product GDP(E) measures total expenditure on the finished or final goods and services produced in the domestic economy or, alternatively, the sum of the final uses of goods and services by resident institutional units *less* the value of net imports of goods and services. It is calculated by adding together the final uses to which output is devoted and can be represented by the following equation:

$$GDP(E) = C + I + G + X - M$$

Where:
- C = Final consumption expenditure by households and the non-profit institutions serving households (NPISHs)
- I = Gross fixed capital formation and the change in inventories
- G = Government consumption expenditure
- X = Exports of goods and non-factor services
- M = Imports of goods and non-factor services

In summary, the following equations can be used to distinguish between gross domestic product calculated in accordance with the three approaches:

Gross domestic product at market prices is shown as:
$GDP_{mp} = C + I + G + X - M$

Gross domestic product at basic prices is:
$GDP_{bp} = GDP_{mp}$ – taxes on products + subsidies on products

Gross domestic product at factor cost is:
$GDP_{fc} = GDP_{mp}$ – (taxes less subsidies on production and imports)

Theoretically, these three estimation methods should provide identical estimates of gross domestic product. Unfortunately, all flows in the economy cannot be measured exactly; consequently, the totals produced by the three approaches will normally not coincide fully except by pure chance. For this reason, the "residual item" is allowed for on the production and expenditure accounts. At current prices it is derived as the difference between a combination of the GDP(P) and GDP(I) methods and GDP(E) estimates and at constant prices between the GDP(P) and GDP(E) estimates.

3.3 Components of expenditure on the gross domestic product, GDP(E)

The gross domestic product is calculated by adding together the individual domestic spending components. The process starts with the preparation of smaller "building blocks" in each expenditure category. These building blocks are then fitted into the larger system in accordance with the various definitions and requirements. The principal source data and estimating methods of the different building blocks vary greatly from block to block. To gain an understanding of the methods applied, the calculation of the various components of expenditure is firstly discussed below, namely: final consumption expenditure by households, government consumption expenditure, fixed capital formation, inventories, and imports and exports.

3.3.1 Final consumption expenditure by households

3.3.1.1 Definition

Final consumption expenditure by households measures the sum of final consumption expenditure on goods and services by resident households, including private non-profit organisations. The *final consumption expenditure of households* consists of all outlays on new goods and services, minus net sales of second-hand goods to other sectors. Where the sale of such goods is between households, neither the sale nor the purchase is recorded as household consumption because they cancel each other out. If, however, purchases are made by dealing in second-hand goods, the trade margin charged by dealers forms part of private consumption expenditure.

In addition, household production of goods and certain services for own consumption are also included to determine households' expenditure. The main items included in such own household consumption are owner-

occupied dwelling services, domestic services and agricultural produce. It is important to remember that for consistency, the equivalent amount of own-account activity recorded as household expenditure must also be recorded in the output and income measures.

Finance costs (in general, all interest payments) of households are not included in private consumption expenditure, but are factored into the net income of unincorporated business enterprises and treated as part of property income.

Two concepts of household final consumption expenditure can be distinguished, namely final consumption expenditure *in the domestic market* and final consumption expenditure of *resident households*. Consumption expenditure in the domestic market consists of the expenditure on domestically available consumer goods and services by both residents and non-residents ("domestically available" goods and services may include imported goods and services). The consumption expenditure of resident households can be derived from this total by adding direct purchases which resident households make abroad and deducting purchases by non-resident households in the domestic market. *The national accounts of South Africa reflect the consumption expenditure of resident households only.*

In the case of non-profit institutions serving households (NPISHs), one of the major recommendations of the 1993 SNA is to provide for NPISHs as a full sector of the System. However, in South Africa, due to a lack of detailed information, these unincorporated enterprises are still part of the household sector. The NPISHs cover all units which have independent legal status – excluding those controlled and financed mainly by the general government. The majority of non profit making institutions is likely to be non-market producers who provide goods and services to other institutional units either free of charge or at prices that are not economically significant. Non profit making institutions which charge significant prices are typically part of the corporate sector. Consequently those non profit making institutions that are not part of general government or the corporate sector are called non-profit institutions serving households. Three broad types of NPISHs can be identified:

- Academic establishments such as religious schools and colleges;
- associations which predominantly serve their members and are financed mainly by subscriptions, for example trade unions, churches, social or recreational organisations and sport clubs; and
- organisations which serve the interests of people other than their members, such as charity and aid bodies financed by donations from the public, government and the business community.

The final consumption expenditure of private non-profit institutions is equivalent to the producer cost of the services and goods which these types of institutions produce.

3.3.1.2 The classification of consumption

Private consumption expenditure can be classified in three ways:

Firstly, such expenditure is classified according to the *nature of the items purchased,* i.e. whether these items are durable, semi-durable or non-durable goods, or services. Semi-durable goods differ from durable goods in that their expected lifetime, which will normally be one year or somewhat more, is generally significantly shorter, and their purchasers' value is mostly substantially less than that of durable goods. Non-durable goods normally have a lifetime of less than one year. The classification of goods according to their degree of durability is valuable for such purposes as assessing households' stock of durable goods and for cyclical analyses of consumer demand. There is also a presumption that wealthier households, or the average household in the world's wealthier economies, devote a relatively larger proportion of their total consumption expenditure to durable consumer goods.

Secondly, consumption expenditure is classified according to *purpose* (sometimes called function), using an internationally agreed standard, the Classification of individual consumption by purpose (COICOP) (see Table 4). The classification of consumption expenditure according to COICOP is a valuable tool for the classification of expenditure for household income and expenditure surveys, for defining meaningful subgroups for consumer price indices and for defining the breakdown of household expenditure when calculating Purchasing Power Parities (PPPs). Under the heading for transport, for example, the purchase of vehicles (motorcars), the operation of personal transport equipment (spare parts and accessories) and transport services are grouped together. In addition, this classification provides information for studies on consumer demand and welfare.

Thirdly, consumption expenditure is classified according to the *kind of economic activity* that the industry is engaged in when producing the relevant commodities, i.e. in accordance with the *Standard Industrial Classification of all Economic Activities.* This classification is provided in the input-output tables and is useful for sectoral analyses.

Table 4. Classification of individual consumption by purpose (COICOP)

Food, beverages and tobacco
Clothing and footwear
Housing, water, electricity, gas and other fuels
Furnishings, household equipment and routine maintenance
Health
Transport
Recreation, entertainment and culture
Education
Hotels, cafes and restaurants
Miscellaneous goods and services

The coverage of household consumption expenditure involves some changes to comply with the 1993 SNA. One of the recommended important changes is the treatment as taxes of payments by households for specific licences, such as licences for vehicles, boats, aircraft and also licences for dogs, or for fishing or hunting. By contrast, payments for vehicle registration, roadworthy certificates, firearm licences, drivers' licences as well as passport and airport fees are treated as payments for goods and services. The borderline between taxes or payments for goods and services from government is defined according to the following criteria: if the licences are issued automatically on payment of the amount due, then the payment is treated as taxes. However, if the government uses the issue of licences as a regulating function to check the competence or qualifications of the person concerned, the payments made should be treated as purchases of goods or services rendered by the government – unless the payments are out of all proportion to the cost of providing the services. Final consumption expenditure in South Africa's national accounts was broadly in keeping with these recommendations. However, some licence fees have been shifted in the general government's income and expenditure account from transfers to direct taxes (i.e. dog, fishing and hunting licences).

In addition, the acquisition of valuables should be treated as gross capital formation. The 1993 SNA defines valuables as assets that are not used primarily for production or consumption, that do not deteriorate over time under normal conditions and are acquired and held primarily as stores of value, such as precious stones, paintings, sculptures and other works of art and antiques. However, in the South African context it has not been possible to estimate acquisitions less disposals of valuables as a separate item in the accounts. Consequently, all expenditure on valuables such as jewellery or paintings by the household sector is included in final consumption expenditure.

3.3.1.3 Principal sources of data and methods of calculation

Although more details are provided in section 4 regarding the sources of data and the methods of calculation, the following general approach is followed in calculating households' final consumption expenditure:

- For benchmark years, the five-yearly survey of income and expenditure of households for selected urban and non-urban areas in the nine provinces of South Africa is used to estimate the average household's expenditure on a specific good in each region. The average value per household is multiplied by the number of households according to the population census to obtain total expenditure on that good. This method ensures that a large part of the informal economy's production is included in private consumption expenditure.
- For in-between years the retail-control method is applied, using an extrapolation of the monthly retail trade sales.
- Quarterly estimates are obtained by means of the extrapolation of benchmark estimates. These extrapolations are prepared from the retail trade sales published in the monthly survey of retail trade by Statistics South Africa. In addition, data published by the Retailer Liaison Committee (a summary of monthly sales by major retail outlets of durable, semi-durable and non-durable consumer goods) and other appropriate surveys are used to confirm the validity of the extrapolated results.
- Constant-price estimates are obtained by deflating all the relevant current-price components by an appropriate element of the consumer price index. In addition, some base-year estimates are extrapolated by appropriate volume indices.

3.3.1.4 Important categories of final consumption expenditure by households

Some of the important categories of final consumption expenditure by households are discussed in more detail in the following paragraphs.

- Expenditure on *personal transport equipment*, such as new motorcars and minibuses, is estimated quarterly by multiplying the number of vehicles sold to final users (adjusted for cars to be used for business purposes) by the average prices of the various types of vehicles. The estimate of the number of vehicles sold is validated by checking it against the number of new motorcars registered for private use. More detailed information from the National Traffic Information System (NaTIS) on the registration of new transport equipment is currently being obtained, and will undoubtedly improve the estimating framework of expenditure on all the components of transport equipment by households. Annual figures are obtained as the sums of the quarterly estimates. Constant-price estimates are obtained by using the number of vehicles sold and registered as extrapolator and the derived deflator is compared with the corresponding component of the consumer price index. The value added by used-car traders is by definition a part of private consumption expenditure. It is estimated by multiplying the number of used cars registered by the average trade margin charged by the used-car trade.
- Consumption expenditure on *food, beverages and tobacco* is estimated quarterly by the National Department of Agriculture. The annual figures obtained in this way are checked against the five-yearly survey of household expenditure, the retail sales survey and the report by the Retailer Liaison Committee on food and groceries sales. For constant-price estimates, the current-price estimates are deflated by the relevant components of the consumer price index. A problem encountered with calculating spending in this category arises from production for own consumption and, more specifically, from subsistence farming in the rural regions. The National Department of Agriculture compiles estimates of this form of expenditure from several sources of information.
- Private consumption expenditure on *petroleum products* is calculated by multiplying the physical quantities of monthly sales of the various petroleum products of the country by the representative retail

prices of such products. This calculation is verified for benchmark years by using the results of the survey on household expenditure and by checks against information obtained from the input-output tables. Constant-price estimates are arrived at by using the quantity of sales as an indicator. The deflator is then compared with the corresponding component of the consumer price index. A problem encountered here is how to determine the value of the retail sales used as the intermediate input in production processes. An analysis of input-output flows provides the basis for distinguishing between final consumption and intermediate consumption.

- Expenditure on gross *rent* covers all rent on dwellings – actual and, in the case of owner-occupied houses, imputed. The rent normally includes payment for the use of the land on which the property stands and fixtures attached to the property. In the case of furnished dwellings for rental, it also includes payment for the use of the furniture. Rent on secondary dwellings, such as seaside houses, cottages and chalets, is also included in this category. The benchmark for outlays on gross rent was calculated by multiplying the housing stock (as determined from the most recent population census) with the average annual rental paid (as quantified by Statistics South Africa in the October household surveys). Quarterly estimates are based on residential capital stock and average rental figures. The real capital stock of residential buildings is used as an indicator for constant-price estimates.
- The regular *maintenance and repair of dwellings* by owner-occupiers and similar expenditures incurred by tenants are part of consumption expenditure. The guidelines are whether the activities that the owner or tenant is obliged to undertake are of a regular nature in order to maintain the dwelling in good habitable order and secondly, whether or not they change the dwelling's performance capacity or expected service life. If they raise the dwelling's performance capacity significantly, the activities fall under capital formation.
- The most difficult part of estimating private consumption expenditure is to determine expenditure on *other services*. It is important to note that in the case of rent, wages of domestic servants, household services, entertainment, recreational and cultural services and personal care services, the value added as estimated for the gross domestic product should be equal to the consumption estimates. It is also important to note that these consumption outlays, as well as expenditure on hospital care and other medical services, are not subdivided into spending components such as food, lodging or other goods and services. Estimates of outlays on financial services are based on information about service costs, such as fees, charges and commissions paid to banks, life insurance, pension fund and other financial institutions. In addition, an imputed value is also calculated for final consumption regarding services provided by banks on financial intermediation services indirectly measured (FISIM). See section 2.2.6.6 for a description of FISIM.

3.3.2 *Consumption expenditure by general government*

Consumption expenditure by general government, including all current outlays for goods and services by the general government, consists of the wages and salaries of government employees and purchases of other non-capital goods and services. Also included in this aggregate is the imputed value of the capital consumption of government fixed assets. The expenditures are measured net of receipts from sales, to avoid double counting. It is estimated from the government's production account in the following way:

Intermediate consumption
plus compensation of employees
plus consumption of fixed capital
less sales of government services
= consumption expenditure by general government

The various public-sector accounts are estimated in accordance with the recommendations of the *Government Finance Statistics Manual* of the International Monetary Fund, the *Public Sector Accounts Handbook* of the United Nations and the recommendations of the 1993 SNA.

Intermediate consumption consists of purchases of goods and non-labour services. The composition and the size of intermediate consumption vary considerably among the different types of services. The government departments where intermediate consumption forms a substantial part of total outlays, include health and welfare services. In departments whose functions are largely of a regulatory or planning nature, intermediate consumption will consist mainly of items such as telephone charges, rent, stationery, computer services and the cost of travel.

Almost all defence expenditures (both for military and non-military configurations) have previously been treated as current rather than capital expenditure and all these outlays have been incorporated in consumption expenditure by general government. The 1993 SNA recommends that only expenditure on military destructive weapons, including their supporting systems, should be treated as consumption expenditure. By contrast, all expenditure by the defence force on fixed assets of a kind that could be acquired by civilians for purposes of production and used by military establishments in the same way, should be treated as fixed capital formation. The 1993 SNA recommendation on this issue has been adopted and outlays on capital goods of a non-destructive nature are now treated as part of fixed capital formation. Likewise, it is also important to note that since these expenditures are treated as capital, estimates of capital consumption allowances have been made.

In calculating intermediate consumption at constant prices, current values are deflated by the relevant components of the production price index.

Compensation of government employees, as included in government consumption expenditure, is a contra-entry of the item that is included in gross domestic product as remuneration of employees. In order to determine compensation of employees at constant values, base-year estimates are extrapolated using employment figures.

Consumption of fixed capital is estimated at replacement cost. In accordance with the 1993 SNA recommendations, the consumption of fixed capital stock imputed to government consumption expenditure now embraces, in addition to government buildings, also roads and structures such as bridges and dams, which for the previous accounts were assumed to have infinite lives and were not depreciated. The calculation of the consumption of fixed capital is discussed in more detail in Section 2.2.6.5.

Sales of government services refer essentially to those transactions in goods and services, as provided by general government bodies, where there is a clear link between the payment for and the acquisition of the goods or services concerned; but the decision to make the payment must be voluntary. Examples of such services are charges for postcards and reproductions by museums, sales of handicrafts made in institutions for the handicapped, sales of goods made by prison inmates, firewood sold by government forestries, publications sold by statistical offices, fees for medical and hospital treatment, school fees, sales of maps and charts and charges made for the use of government computer services. However, this category excludes any fees which are levied for regulatory purposes. Sales of government services at constant value are estimated by dividing nominal spending totals by appropriately constructed price deflators.

3.3.2.1 Individual and collective consumption expenditure by general government

Final consumption expenditure by general government, as described in the previous section, comprises outlays on goods and services that are directly used for the satisfaction of individual needs or wants, or the collective needs of members of the community. This expenditure may take place within the boundaries of the country or abroad.

The 1993 SNA divided final consumption expenditure by general government into two categories, namely:

- individual consumption; and
- collective consumption.

Individual consumption expenditure is on goods and services which are supplied to individual households to satisfy the needs of that household. Expenditure by general government on the following functions, is normally treated as individual:

- health;
- education;
- social security and welfare; and
- recreational and cultural activities.

As indicated in Section 2.2.6.7, individual consumption expenditure of general government may be added to final consumption expenditure by households to obtain the actual final consumption of households.

Collective consumption refers to those services that are provided simultaneously to all members of the community, or all members of a particular section of the community. In contrast to individual goods and services, collective services cannot be bought or sold in the market; they are mainly financed by government through tax receipts. The distinction between individual and collective consumption is summed up respectively by the following characteristics:

Individual consumption

- It must be possible to observe the acquisition of the good or service by an individual household or member thereof, and also the time at which it took place.
- The household must have agreed to the provision of the good and service, and take whatever action is necessary to make it possible.
- Acquisition of the good or service by one person, household or small group precludes its acquisition by others.

Collective consumption

- These services can be delivered simultaneously to every member of the community, or of a particular section of the community.
- The use of such services is usually passive, and does not require the explicit agreement or active participation of the individual concerned.
- The provision of the service to one person or household does not reduce the amount available to others in the same community.

3.3.3 Gross fixed capital formation

3.3.3.1 Definition

The 1993 SNA defines gross capital formation as the total value of gross fixed capital formation, changes in inventories and acquisitions less disposals of valuables. The latter is a new addition to the definition of gross capital formation. Valuables consist of precious stones and metals held by any unit, including enterprises, provided that they are not intended to be used as an intermediate input in production processes. Paintings, sculptures, recognised works of art and antiques and other valuables such as jewellery fashioned from precious stones and metals, also count as valuables. Although this is an important additional category to deal with in the capital account, which also applies to the

expenditure side of gross domestic product, it has not been possible to include any estimates of valuables in the South African national accounts. There are simply no reliable data available. Consequently, the subsequent paragraphs focus on the more conventional issues related to gross fixed capital formation.

Gross fixed capital formation represents expenditure on tangible or intangible assets which have been produced and are themselves used repeatedly or continuously in the processes of production for more than a year. Tangible assets include not only buildings and equipment but also cultivated assets such as trees and livestock, whereas intangible acquisitions cover such items as the cost of mineral exploration, computer software (where used in production for more than one year) and original works of literature or art. In addition, gross fixed capital formation consists of the outlays of private and public producers on tangible or intangible objects which do not enter directly as intermediate consumption into the production process. The fundamental distinction between intermediate consumption and capital formation is whether the goods or articles concerned are considered to be exhausted during an accounting period or whether they will yield benefits in the future.

The demarcation of intermediate consumption and gross fixed capital formation is important for the classification of assets. Intermediate consumption measures the value of goods and services that are transformed or entirely used up in the course of production during the accounting period. By contrast, gross fixed capital formation is measured largely by the value of its acquisitions less disposals of new or existing fixed assets. Work-in-progress on uncompleted heavy machinery and equipment is included in gross capital formation and forms part of the stock of producer goods. Work put in place on structures is included in fixed capital outlays at the unit for which the construction is carried out. However, outlays on research and development are not treated as fixed capital and the position of the 1968 SNA will remain, i.e. all expenditure on research and development and training is treated as intermediate expenditure. An analysis of research and development expenditure in a satellite account may, of course, provide useful additional information. Similarly, expenditure on the current repair and maintenance of fixed assets is also regarded as intermediate consumption. However, significant alterations, additions and replacements are classified as fixed capital formation if the newly incorporated parts have an expected lifetime of one year or more, for example replacements of the engines of trucks and alterations to buildings.

Expenditure on mineral exploration, whether successful or not, is needed to acquire new reserves and is therefore treated as gross fixed capital formation. Consumption of fixed capital may be calculated for such assets by using the average service lives similar to those used for the assets of mining corporations.

The revised SNA states that all expenditure by the defence force on fixed assets of a kind that could be acquired by civilian users for purposes of production and used by military establishments in the same way, should be treated as fixed capital formation. This would include hospitals, schools, roads, bridges, airfields, docks and other buildings or structures.

However, military weapons of destruction and the equipment needed to deliver them, such as rockets and missiles, warships, submarines, fighter aircraft and bombers, should still be treated as intermediate expenditures. The 1968 SNA excluded from gross fixed capital formation almost all military expenditure, except the construction or alteration of family dwellings for personnel of the armed forces. Weapons or armoured vehicles acquired by police or security services are treated as fixed assets, although expenditures on the same kind of equipment by military establishments are treated as intermediate expenditure.

Major expenditure on computer software is to be treated as gross fixed capital formation. All computer software that a producer expects to use in production for more than one year should be treated as an intangible fixed asset, whether it is purchased separately or with the hardware or developed in-house. It also includes databases which the enterprise expects to use for more than one year. In the 1968 SNA, software purchased or developed independently and not bought as an integral part of major hardware is treated as intermediate consumption.

Literary or artistic works produced for sale are treated by the 1993 SNA as part of output. It therefore recommends that original creations such as films, the writing of books, music composition and other literature and art works should be treated as capital formation. Owing to insufficient data sources in this area, it is not possible to implement the recommendation.

As indicated above, the 1993 SNA recommends that the acquisitions less disposals of valuables should be included in the concept of gross capital formation. Valuables are defined as produced assets not used primarily for production or consumption, that do not deteriorate over time under normal conditions and are acquired and held primarily as stores of value. Examples of valuables are precious metals (non-monetary gold if used as a store of value), precious stones, antiques and other art objects. These acquisitions less disposals of valuables are treated in various ways in the 1968 SNA. In the case of households, for instance, the 1968 SNA regards such acquisitions as final consumption expenditure.

Another convention refers to inventories of structures. According to the 1993 SNA, the output by construction enterprises must be recorded as work-in-progress or as additions to the producer's inventories of finished goods when there is no contract of sale agreement in advance, depending on whether the construction is completed. For example, residential units built for speculation remain additions to producer's inventories until they are sold.

Other changes in basic concepts and recommen-

dations, concerning capital formation, proposed in the 1993 SNA, are as follows:

- The new SNA draws a clear distinction between financial leasing and operating leasing. The latter is defined as the activity of renting out machinery and equipment for periods shorter than the expected service lives of the capital equipment. This is a form of production in which the owner, or lessor, provides a service to the user, or lessee, and the output is valued by the rental which the lessee pays to the lessor. By contrast, financial leasing is not a process of production in itself, but a method of financing the acquisition of fixed assets and therefore fully incorporated into the estimates for fixed capital formation.
- In principle, the construction of and major improvements to historical monuments should be recorded as fixed investment. They are usually accessible to the general public and visitors are often charged for admission to the monuments or their vicinity. Their owners, who may be government units, non-profit institutions, corporations or households, typically use historical monuments to provide cultural or entertainment-type services. Depreciation allowances on monuments should be calculated on the assumption of appropriately long service lives.
- Human capital has not been introduced in the 1993 SNA.
- Where appropriate, depreciation allowances should be calculated for infrastructural works such as roads and other assets previously treated as having infinite service lives. Although certain structures such as roads, dams, bridges and railway lines may appear to have infinite lives if properly maintained, it is also true that the value of assets may decline not only because they deteriorate physically, but also because of a decrease in the demand for their services, owing to technical progress and the availability of new substitutes.

3.3.3.2 Classification

Gross fixed investment is classified by type of economic activity, type of organisation and type of asset. The classifications by type of economic activity and by type of organisation (i.e. private sector, public corporations or general government), correspond to those of other national accounts aggregates. In the classification by type of asset the following categories are normally distinguished:

- Residential buildings;
- non-residential buildings;
- other construction and land improvements;
- transport equipment; and
- other machinery and equipment.

Currently it is not possible to expand the classification of assets explicitly according to the recommendations of the 1993 SNA and, for example, to show investment in computer equipment separately. There are not enough reliable data available.

Investment in residential buildings consists of the value of work put in place on the construction of buildings which are entirely or primarily dwellings (houses and flats); expenditure on major alterations and additions to these buildings; and transfer and similar costs in respect of the purchase (or sale) of existing residential buildings. Included is the installation of new permanent fixtures such as fixed stoves, central heating, air conditioning, lighting, plumbing and water-supply facilities, and all other fixed equipment customarily installed before dwellings are occupied.

Investment in non-residential buildings consists of the value of work put in place on buildings and structures which are entirely, or primarily, for industrial or commercial use; outlays on non-residential government buildings such as schools, hospitals and administration buildings; outlays on major alterations of and additions to these buildings and structures; and transfer and similar costs in respect of purchases (or sales) of existing non-residential buildings. Examples of private non-residential buildings are factories, warehouses, office buildings, stores, restaurants, hotels, garages and farm buildings. Also included are outlays on the installation, alteration and improvement of these structures.

Fixed investment on other construction and land improvement comprises the value of work put in place in respect of the construction and major alteration or renewal of works, such as permanent roads, bridges, harbours, car parking facilities, airports, pipelines, oil wells, mine shafts, dams and drainage.

Fixed investment on transport equipment includes the purchasers' value of new completed ships, aircraft, railway rolling stock, trucks and motor vehicles and outlays on major alterations or improvements to existing transport equipment.

Fixed investment in machinery and equipment includes the purchasers' value of new durable goods not elsewhere classified, such as agricultural machinery; power-generating machinery; computers and computer-related equipment; office machinery, equipment, furniture and furnishings; art objects; mining, construction and other industrial machinery; cranes and forklift equipment; durable containers; equipment and instruments used by professionals; and equipment, furnishings and furniture for use by, *inter alia,* hotels, boarding houses, restaurants and hospitals. Items of small value, such as hand tools and inexpensive office desk equipment, are treated as current expenditure. However, imports of second-hand equipment described under the categories for machinery and equipment and transport equipment, are treated as fixed capital formation.

3.3.3.3 Principal sources of data and methods of calculation

The following general approach is followed in determining gross fixed investment:

- *For benchmark years* fixed investment is calculated by using the census results published by Statistics

South Africa. Estimates of investment in buildings are verified against the value of buildings completed, as surveyed monthly by Statistics South Africa.

- *Estimates for other years and quarterly estimates* are determined by means of extrapolation and interpolation based on information obtained from quarterly sample surveys of financial statistics collected by the South African Reserve Bank and Statistics South Africa. Preparations for verifying these estimates are at an advanced stage, by means of a countrywide corporate survey on economic data, to be conducted annually by Statistics South Africa. Outlays on transport equipment are also verified by the retail and wholesale control method. Outlays on buildings are verified against the value of buildings completed as surveyed monthly by Statistics South Africa.

3.3.3.4 Important categories of gross fixed capital formation

Some of the important categories of gross fixed capital formation are discussed in more detail in the following paragraphs.

- *Investment in private residential buildings* comprises the value put in place on and the major alterations and additions made to permanent-site housing, including single-family housing units, duet housing units, townhouses, retirement units, flats and timesharing units in large cities, metropolitan areas, towns and villages. This category is estimated from the results of Statistics South Africa's monthly survey of buildings completed. Benchmarks are estimated from annual surveys by Statistics South Africa. The cost at completion as submitted by the local authorities, is reallocated to previous months to provide for the actual time when the values accrued. It is important to note that residential buildings completed by other economic sectors, for instance the mining sector or the farming community, are shown as investment in residential buildings by that sector. Self-help schemes are included in this category, but outlays on materials for constructing squatter units are generally included in consumption expenditure.
- *Estimates of capital expenditure by public utilities* and *public corporations* are derived from quarterly and annual information which is obtained directly from the utilities and corporations.
- *Capital expenditure by public authorities* is obtained from an analysis of government finance statistics. However, it is important to note that the distinction made by government departments and agencies between current and capital expenditure is not accepted as such but is adjusted to conform to national accounting definitions and specifications. For the implementation of the 1993 SNA recommendation on defence expenditure (to distinguish between consumption and investment expenditure), a detailed reclassification of outlays on goods and services by the South African National Defence Force has been developed.
- *Information on capital expenditure on goods for operating leasing* is obtained from financial institutions by the Reserve Bank. This capital expenditure is attributed to the sector "financial intermediation, insurance, real estate and business services".

3.3.3.5 Fixed capital formation at constant prices

The Reserve Bank compiles three separate price indices for the deflation of nominal expenditure on residential buildings, non-residential buildings and other construction works respectively. Incorporated in the indices are costs of materials, labour costs, overhead costs and profit margins. Expenditure on transport and other equipment is deflated by components of the production price index. Transfer costs are deflated by the price index for residential buildings.

3.3.4 Change in inventories

Change in inventories is a subcomponent of gross capital formation to account for that part of current production not yet sold, i.e. an increase in inventories, or that part of earlier production which is sold or used for further processing in the current accounting period, i.e. a reduction in inventories.

In the national accounts, inventories are defined to include

- the materials and supplies owned by producers, that were purchased for intermediate consumption but are as yet unutilised;
- finished goods produced for sale that are still unsold;
- goods for resale which consist of outlays by wholesalers and retailers on goods for the purpose of reselling them without further processing, except for presenting them in ways that are attractive to the customer; and
- work-in-progress: this consists primarily of goods which have been partially completed but are not yet ready to be used by other units without additional processing or that are not mature and for which the production process will be continued in a subsequent period by the same producer. These goods consist of work-in-progress on cultivated assets such as trees and livestock and "other" work-in-progress. The latter reflects outlays on structures and other fixed assets that typically take a long time, e.g. two or more accounting periods, to complete. However, the output produced in an accounting period is treated as work-in-progress only when the producer, and not the eventual user, is the owner of the output produced. Consequently, this subcomponent excludes partially completed structures for which the ultimate owner is deemed to have taken ownership.

In addition, all inventories held by government, including, but not limited to, inventories of strategic materials and agricultural stocks-in-trade should in principle be part of total inventories.

Data for the various categories of work-in-progress are not explicitly available in South Africa's national accounts. Likewise, inventories held by general government, except for strategic inventories, are not included in the aggregate level of inventories. As the general departments of government normally maintain a fairly stable level of operational material, it can be argued that there is presumably little or no change in the average level of inventories held by general government between accounting periods that can affect the calculation of the expenditure on gross domestic product.

3.3.4.1 Principal sources of data and methods of calculation

As in the case of fixed investment, data on the value of inventories are obtained from the various censuses and quarterly surveys of Statistics South Africa. These estimates are verified by and supplemented with information obtained from marketing agents and sample surveys done by the Bank.

When revaluing inventories, the assumption is that the FIFO (first in first out) method of inventory accounting is most prevalent. To revalue inventories at average market prices, an estimate of the average inventory turnover time is required. The ratio of inventories to sales serves this purpose (see Section 2.2.6.4 for more details of the methods for inventory valuation).

3.3.4.2 Classification

Inventories are classified by type of economic activity and by type of organisation.

3.3.5 Imports and exports

Exports and imports of goods and services represent the value of transactions between residents and non-residents. The data are an integral part of the expenditure-based method to measure the gross domestic product and they are also major components of the balance of payments accounts. In the annual national accounts the data on total imports and exports are subdivided into merchandise imports and exports (including gold exports) and service payments and receipts to and from the rest of the world. The latter payments and receipts comprise four categories of services, namely freight and merchandise insurance; other transportation; travel; and other services.

Net income payments to the rest of the world (interest, dividends and compensation of employees paid to and received from the rest of the world) which, according to the 1993 SNA, are part of primary income, are not accounted for in the production account.

3.3.5.1 Merchandise imports and exports

Merchandise imports and exports include most movable goods which change ownership from residents to non-residents and vice versa. Exclusions include goods in transit through a country and goods sent by road for minor processing, maintenance, service or repairs. In principle, imports and exports should be recorded when ownership changes but in practice, recording often takes place when the parties to the transaction enter it in their books or accounts. This date is not necessarily the contract date, transfer date or payment date. In addition, merchandise imports and exports are recorded on a free on board (f.o.b.) basis.

3.3.5.2 Imports and exports of services

Freight and merchandise insurance measures the outlays on these activities performed by resident and non-resident transport operations and insurers respectively on merchandise exports and imports.

Other transportation comprises the passenger services provided to non-residents by resident transport operations and vice versa. Also included are miscellaneous services and port expenditures between South African ports and overseas ports, depending on the import and export activities respectively.

Travel is the acquisition of goods and services in South Africa by non-resident travellers. In the case of imports, its counterpart reflects expenditure abroad by resident travellers.

Other services mainly consist of the value of miscellaneous goods and services acquired by non-residents or residents through embassies.

3.4 The deconsolidation of gross domestic production, GDP(P) and income, GDP(I)

As briefly discussed in Section 3.2, the gross domestic product can be calculated either by following the production approach or by using the income approach. The production approach entails the calculation of the gross domestic product, GDP(P), as the difference between the value of the gross output of producers and the value of their intermediate consumption during a specific accounting period. By contrast, the income approach, GDP(I), involves the summation of incomes accruing to production factors, i.e. compensation of employees and the gross operating surplus of economic entities.

Estimates of the gross domestic product according to the production and income methods represent value added at basic prices and factor cost, respectively. Therefore, to align these estimates with the calculation of the gross domestic product according to the expenditure method, GDP(E), adjustments for "indirect" taxes and subsidies should be incorporated into the first two methods.

Given the definition of the gross domestic product at market prices from the expenditure side, GDP(E), as explained in Section 3.2.3, the following identities hold:

GDP_{mp} = The sum of gross value added at basic prices
plus taxes, *less* subsidies on products

GDP_{mp} = The sum of gross value added at factor cost *plus* all taxes, *less* subsidies on production and imports

According to the recommendations of the 1993 SNA, the term "indirect taxes" should be replaced by the term "taxes on production and imports" while "commodity taxes" and "other indirect taxes" should be replaced by the expressions "taxes on products" and "other taxes on production".

Taxes on products refer to taxes which are payable per unit of some good or service. Examples of these taxes include the following:

- Value-added type taxes (VAT);
- taxes and duties on imports;
- taxes on exports; and
- taxes on products, excluding VAT, import and export taxes.

Other taxes on production consist of all taxes, except taxes on products payable by enterprises owing to the production of goods and services. Examples of these taxes include the following:

- Payroll taxes;
- recurring taxes on land, buildings or other structures;
- business and professional licences;
- taxes on the use of fixed assets;
- stamp taxes;
- taxes on pollution; and
- taxes on international transactions.

Likewise, *subsidies on production* are classified as follows:

- *Subsidies on products.* These subsidies are for example direct subsidies payable per unit exported to encourage exports, and product-linked subsidies on products used domestically.
- *Other subsidies on production.* These are for example subsidies on the payroll or workforce and subsidies to reduce pollution.

Compensation of employees covers the gross salaries, wages and allowances of employees, whether in cash or in kind, including employers' contributions to holiday, pension, provident and medical funds, but before deducting employees' contributions to these funds and their income tax. It is recorded on an accrual basis, which implies that it is in respect of entitlement arising from work done during the accounting periods whether paid in advance, simultaneously, or in arrears. It does not cover unpaid work (including work done by household members within their own household) or the earnings of the self-employed. Remuneration in kind refers to goods and services that are in general used by employees in their own time and at their own discretion for the direct satisfaction of their needs or wants and includes items such as regular meals, low-interest housing loans, company cars and travel to work. By contrast, goods and services are recorded as intermediate consumption where employees need to use them in order to do the job, such as tools, special clothing, accommodation at the workplace and travel on business trips.

The *gross operating surplus* comprises gross output less the intermediate consumption and remuneration of employees, or for the various sectors of economic activity it can be obtained by adding together factor income (excluding labour) by a particular economic sector. The accompanying example of typical production, income and expenditure data of a firm in the transport sector, illustrates how the gross domestic product can be calculated by means of the *production* and the *cost* or

Value added according to the production method

Sales and transfers out		**1124**

income approaches. Total sales in the production method are adjusted for the change in inventories, derived from the work-in-progress and finished goods; and intermediate consumption includes the changes in inventories of raw materials.

Before total value added can be calculated, an important adjustment has to be made, namely for financial service charges. This is an indirect measure of the value of services for which financial intermediaries do not explicitly charge but obtain their reward from the difference between interest receivable and interest payable.

In contrast to the 1968 SNA, the 1993 SNA recommends in principle the allocation of financial intermediation services indirectly measured (FISIM) to intermediate consumption by enterprises or final consumption or exports. Banks and sometimes other financial institutions generally receive interest for the services they render, but these receipts are not regarded as payment for the sale of services or as production cost. If these institutions were treated like other establishments and their gross output measured as charges for services rendered, they would have had negative value added because most of their income is generated by charging a higher rate of interest on advances made, than on their costs of funds. In accordance with the 1968 SNA, South Africa's national accounts have allocated the "imputed" financial service charges to a notional industry which buys the entire service as an intermediate expense and generates an equivalent negative value added.

In the implementation of the 1993 SNA, FISIM replaces the financial services adjustment previously used in the South African accounts. Consequently, FISIM (output) is now allocated among the various users of such services, such as businesses, households, government and the rest of the world. The portion attributed to the corporate sector is an intermediate expense and therefore does not affect the level of gross domestic product for the entire economy, but the household sector and the government are final demand sectors and do contribute to gross domestic product. This is a major change from the 1968 SNA guideline in the treatment of FISIM. This suggestion was not free of controversy, as several countries did not have the infrastructure, or did not wish to allocate FISIM charges to the users. For this reason, the 1993 SNA further recommends flexibility in the way in which this output is allocated, including not allocating any output to the final demand, which is equivalent to the 1968 SNA treatment.

In adopting the 1993 SNA recommendations to implement FISIM and in using reference rates for distributing FISIM between borrowers and depositors and among sectors, calculations were based on the data that banks are legally compelled to provide to the Bank Supervision Department of the South African Reserve Bank. Reference rates were obtained from the ratio between total interest paid and received, relative to the stock of deposits and advances by the institutional sectors. In addition, the allocation of the output to the users in the corporate sector was broadly in keeping with their flow of interest payable or receivable, according to census results and other corporate surveys conducted by Statistics South Africa.

The old methodology for calculating FISIM included in the estimates the output of the South African Reserve Bank, the Land Bank and the Industrial Development Corporation. The 1993 SNA suggests that central banks should be treated in the same way as all other financial intermediaries. However, as the central bank plays a different role from other banks, a different treatment seems justified. The main function of the South African Reserve Bank is to formulate and implement an effective monetary policy. Consequently the Inter-Secretariat Working Group on National Accounts (ISWGNA), which consists of representatives of the European Union, IMF, OECD, United Nations and the World Bank, discussed the treatment of the output of central banks during the working group's deliberations in 1995. A number of concerns were raised owing to the large positive or negative values for gross output and possibly even a high volatility in output. The working group agreed that the SNA treatment should continue to be recommended as the first approach. However, where this method led consistently to inappropriate results, output could, as a second-best approach, be measured at cost but the central bank would remain part of the financial corporate sector regardless of how its output was measured. As a result of these developments it was decided that the Reserve Bank would not be included in the calculations of FISIM. It was also decided that the main focus would be on those institutions which, strictly speaking, operated mainly as financial intermediaries, such as the commercial banks, and that this would exclude, for the calculation of FISIM, institutions such as the Development Bank and the Industrial Development Corporation.

It is worth mentioning that the relatively complicated treatment of the imputation and allocation of intermediation services fortunately does not affect the level of saving in the sector accounts. The additional expenditure on imputed services for deposits by, for example, the household sector is balanced on the income side by an imputed income which is equal to such expenditure, whereas additional expenditure on imputed services, regarding interest payments on loans by the household sector, is counterbalanced by an equal reduction in loan interest expenditure – called the "transfer portion" of loan interest.

Another important recommendation of the 1993 SNA is the treatment of the output of insurance companies. The pre-revision calculations of the value added by long-term insurers was based on the sum of the remuneration of employees and an estimated operating surplus comprising depreciation allowances, income tax payments, interest and dividend payments and surplus funds transferred from foreign branches to head office. To be in keeping with international practices, South Africa's national accounts have adopted the recommendation of the 1993 SNA. Consequently the methodology for calculating output has been changed and for life insurance it is defined as premiums *less* claims, *plus* investment income from the technical reserves, *less* increases (*plus* decreases) in actuarial reserves. In general, this formulation of output is broadly congruent with the value of total administrative costs of insurance companies and their distributed profits to policy holders. The output of short-term insurers is defined as including actual premiums earned, *less* claims due *plus* investment income from technical reserves. The technical reserves are the sum of prepaid premiums and reserves against outstanding claims.

The total output of life insurance as calculated in the preceding paragraph, less all expenditure on intermediate goods and services (administrative cost, excluding salaries and wages) is equal to the value added by these institutions. The output of life insurance is used entirely as final consumption expenditure. The services used by non-residents are the only exception. Subsequently, the output of life insurance services should be distributed between the household sector and the rest of the world in proportion to premiums payable by resident and non-resident households. Expenditure on life insurance services by residents is treated as part of households' final consumption expenditure, whereas the services consumed by non-residents are part of exports of services. By contrast, expenditure on non-life insurance services may be classified as intermediate consumption by any resident sector or as final consumption expenditure by households or as exports.

The statistical sources and methods of calculating the gross domestic product according to the production and income approaches are summarised in Section 4 of this supplement. In addition, constant-price estimates are obtained by extrapolating base-year calculations or interpolating between base years, using changes in selected volume indices.

3.5 The informal sector

The term "informal sector" stemmed roughly from developments in the early 1970s when it became important to describe some of the characteristic features of the dual nature of the production system and employment situation as commonly found in developing countries. In many developing countries, the past two decades were characterised by structural and economic changes. Under these conditions, the informal sector experienced an unprecedented and unexpected growth. Currently it is generally accepted that the informal sector has its own development dynamics and that it will not disappear in the foreseeable future. On the contrary, it is likely to grow in importance, since it is one of the major sources of employment and income for large proportions of the population in developing countries, including South Africa.

The development of statistics on the informal sector as an integrated part of the national statistical system of a country is an important prerequisite for the design of appropriate policies for the sector. However, it is also obvious that informal sector activities do not easily lend themselves to statistical measurement. The major difficulty lies in agreeing upon internationally accepted guidelines relating to the statistical definition of the informal sector. This can be attributed to the fact that the concept of the informal sector has been defined in different contexts with different meanings, which leads to confusion among data users and hampers comparisons of the statistics. This concept covers a heterogeneous set of activities which vary among regions and countries. In addition, statistical definitions of the informal sector can be influenced by the feasibility of data collection, the survey instruments used and the selected observation units chosen. Under these circumstances it is extremely difficult to formulate a concise definition of the informal sector.

However, the informal sector may be broadly described as consisting of economic units engaged in the production of goods and services for their own account with the primary objective of generating income and employment for the persons concerned. These units normally operate on a small scale and with little or no division between labour and capital as factors of production.

For statistical purposes, the informal sector is regarded as a group of production units which, according to the definitions and classifications provided in the 1993 SNA, form part of the household sector as household enterprises or, equivalently, non-incorporated enterprises owned by households. Intermediate expenditure on production is often indistinguishable from household expenditure. Likewise, capital equipment such as buildings or vehicles may be used simultaneously for business and household purposes. In addition, informal sector activities are not necessarily developed with the deliberate intention of evading the payment of taxes, or infringing labour or other legislation. Accordingly, the concept of informal sector activities should be distin-

guished from the concept of the activities of the hidden or underground economy.

Within the household sector, the informal sector encompasses the following:

- Informal own-account enterprises, which are owned and operated by own-account workers who sometimes employ members of the same or other households. This category may include employees on an occasional basis but not on a continuous basis.
- Enterprises of informal employers which are owned and operated by such employers. They employ one or more employees on a continuous basis. While most informal sector units start as own-account enterprises, the more successful ones tend to grow over time and employ a few employees on a continuous basis.

For operational purposes, enterprises of informal employers may be defined according to the following criteria:

- Size of the unit in terms of employment. This will most likely be the number of employees employed on a continuous basis.
- Non-registration of the enterprise or its employees. Registration of the enterprise may refer to registration under specific forms of legislation such as commercial or factory acts, tax laws or other regulations established by national legislative bodies.

In South Africa the abolition of influx control and the repeal of several other regulatory measures since 1986 has prepared the way for many new initiatives in the informal economy. The emergence of the informal sector necessitated the incorporation of this segment of the economy into the official national accounts aggregates. Previously, only certain elements of informal activity, particularly in the agricultural sector, the private transport sector and estimates for domestic servants, were accounted for in the official gross domestic product statistics. The presumed growth of informal economic activity since the middle of the 1980s made it necessary to include in the official figures the value added by the rest of the informal economy too. The net result of these developments was an upward adjustment in the level of the revised estimates of aggregate gross domestic product at market prices during the previous (1994) rebasing and revision exercise, to account for a broader spectrum of informal economic activities.

In 1994, South Africa entered into a new political dispensation, which also brought new developments which stimulated the informal economy. The restructuring of the civil service and several parastatal organisations, the outsourcing of a number of staff functions by general government and private business enterprises together with an increase in international competition led to a substantial increase in job shedding through retrenchments and early retirement packages. Although a number of these employees returned to active participation in economic activities through other and sometimes newly developed formal structures, a substantial number of workers became dependent on the informal sector for employment and income. In addition, the relaxation of certain restrictive legislation regarding informal settlements also encouraged informal economic activities.

Initially the data that serve as the basis for the estimates of the value added by the informal sector, came from a revised household survey conducted by Statistics South Africa in October 1993. This survey focused on the activities of the informal economy. Currently, the annual October Household Surveys conducted by Statistics South Africa are one of the basic sources of information for estimating the activities of the informal sector in South Africa. Another source relates to potential retail sales. According to current estimates, the value added by the informal sector accounts for approximately 7 per cent of South Africa's gross domestic product at market prices.

3.6 An outlay of the national income and production accounts

In addition to the production and expenditure account, three other important accounts are distinguished in the outlay of the national accounts, namely the national income and appropriation account, the capital finance or saving and investment account and the account with the rest of the world.

3.6.1 Summary of the gross domestic product and expenditure

This account (see Table 5.1) gives a summary of the main components of the production, income and expenditure approaches to estimating gross domestic product at market prices. The main aggregates, such as total output, intermediate consumption, compensation of employees, gross operating surplus, consumption and investment, taxes on production and imports net of subsidies and the transactions with the rest of the world, are grouped together in supply and demand components. Theoretically, the three methods of estimating gross domestic product should provide the same results, but they differ in practice because their components are estimated using largely independent and less than perfect data sources. Consequently, it is necessary to allow for a "statistical discrepancy" or "residual item", to reconcile the production/income estimates and the expenditure estimates.

3.6.2 National income, disposable income and its appropriation

Table 5.2 gives a summary of national income, disposable income and its appropriation. Gross national income at market prices is the gross market value of

goods and services attributable to labour and property (production factors) supplied by South African residents. Gross national disposable income is equal to the gross national product at market prices and net current transfers from the rest of the world. The national disposable income represents the amount available for consumption expenditure (private and government) and saving.

3.6.3 Households' income and outlay account

The income and outlay account of households (see Table 5.3) consists of all current transactions of households, unincorporated business enterprises (proprietors and partnerships) and non-profit institutions. Households' current income is calculated as the sum of salary and wage disbursements, income from property after inventory valuation and capital consumption adjustments, rental income after adjustment for maintenance cost, personal dividend income, net interest income and transfer receipts. Transfer payments to persons are income payments to persons for which no current services are performed (in other words, without any associated *quid pro quo*). These payments to persons consist of business transfer payments such as donations and bursaries, and payments by general government. Government transfer payments include benefits such as social security assistance for old-age pensioners, disability insurance, unemployment insurance and supplementary medical insurance.

Disposable income is current income by households less taxes on income and transfers, including donations and fees, fines and forfeitures. It is the income available to households for spending or saving. Saving is the balancing item in the income and outlay account of households and includes the retained income of unincorporated business enterprises, non-profit institutions serving households and private households.

3.6.4 The income and expenditure account of incorporated business enterprises

The account, as presented in Table 5.4, is a summary of the income and expenditure activities of financial and non-financial private incorporated business enterprises and public corporations. The corporate account is also disaggregated by type of economic activity. Estimates for the benchmark years were to a large extent obtained from Statistics South Africa's census results for incorporated business enterprises. In-between years and quarterly estimates are based on sample surveys of the income statements of business enterprises.

The disposable income of the corporate sector is derived from the operating surpluses of incorporated business enterprises, adjusted for net transfers of income from property received. On the expenditure side of the account, taxes and transfers are the main uses against income, and net saving is the balancing item of the account.

3.6.5 The current income and expenditure account of general government

The receipts and outlays recorded in the government account (see Table 5.5) are mainly obtained from the set of government finance statistics. These statistics are compiled from data obtained from the various government institutions and from audited reports. The aggregated information in this account consists of a summary of the income and expenditure items of all three tiers of general government, namely central government, provincial governments and local authorities. In addition, the account also includes data from the extra-budgetary institutions and business enterprises of general government. The operating surpluses or the losses of these institutions are defined as income from property on the receipt side of the account.

The disposable income of general government is calculated as the sum of income from property by business enterprises of general government, interest and dividends received by general government after adjustment for interest paid on public debt, taxes on production and imports and all other transfers received. Outlays by general government consist mainly of consumption expenditure which, in accordance with the recommendations of the 1993 SNA, is divided into individual and collective expenditure. Total consumption expenditure can also be divided into total salaries and wages and goods and services of a non-capital nature. Salaries and wages amounted to about 70 per cent of total consumption expenditure by general government. The remaining expenditure items are subsidies and other current transfers to households and the rest of the world. The latter consist of outlays such as grants to foreign governments and retirement benefits to former residents of South Africa. Likewise, subsidies are the monetary grants paid by government to private business enterprises and to government enterprises at a different level of government. Net saving is also the balancing item in the government account.

3.6.6 Account with the rest of the world

The consolidated account of foreign economic activities (see Table 5.6) is a summary of all the transactions of resident economic agents with the rest of the world. The data are collected by the South African Reserve Bank from its own sample surveys, import and export statistics which are published by the Directorate: Customs and Excise of the South African Revenue Service, and various other sources. All foreign transactions are compiled in accordance with the recommendations of the fifth edition of the *Balance of Payments Manual* of the International Monetary Fund. The balancing item in the external transactions account is the current account balance which is South Africa's exports of goods and services and receipts of primary (factor) income, less imports of goods and services by South Africa, payments of primary (factor) income and net transfer payments to the rest of the world. Capital transactions in the balance of payments are also

summarised in this account and represent the net capital movements to the rest of the world and the change in gold and other foreign reserves. The net result of these movements is reflected in the balance (surplus or deficit) on the current account. In practice, this shows to what extent a country has to rely on foreign savings to finance national investment, or has surplus funds to service foreign debt or to invest abroad.

3.6.7 Gross saving and investment account

Table 5.7 summarises the total outlays on investment and gross saving in the total economy. Gross saving in the national accounts represents that part of gross national disposable income which is not disbursed as consumption expenditure (see Table 5.2). Saving is retained income, resulting from the postponement of consumption. It is measured as a balancing item in the income and outlay accounts of the domestic institutional sectors, after current receipts and disbursements have been accounted for. Capital gains and losses are excluded from saving in the national accounts. Net saving represents that part of gross saving not provided by the consumption of fixed capital. Foreign investment reflects the net result of capital movements to the rest of the world and the change in gold and other foreign reserves (see Table 5.6). In addition, net lending (+)/borrowing (-) for the total economy is defined as gross domestic saving *plus* net capital transfers from the rest of the world, *less* gross investment. This is also the balancing item in the saving and investment account, which is equivalent to the capital account in the set of integrated economic accounts. In the case of capital transfers receivable, whether in cash or in kind, the recipient may acquire assets or repay liabilities. By contrast, capital transfers payable imply that assets are disposed of. Consequently, net lending or borrowing, being the difference between changes in net worth (due to gross saving and net capital transfers) and gross investment, shows the amount of resources available for the purpose of lending or that needs to be borrowed. It represents the net resources that the total economy makes available to the rest of the world (if the difference is positive) or receives from the rest of the world (if the difference is negative).

Summary of national income and production accounts for South Africa

Table 5.1 Gross domestic product and expenditure account

R billions

Supply	1995	1998
Production approach		
Output of goods and services, at basic prices	1008,9	1343,1
Less intermediate consumption, at purchasers' prices	508,6	670,0
Gross value added at basic prices	*500,3*	*673,1*
Plus taxes on products	53,6	69,7
Less subsidies on products	5,8	5,0

4. Principal sources of data and methods of calculation*

4.1 Gross domestic product according to the production and income methods[1,2]

Sector	Subsector	Annual estimates	Quarterly estimates	Constant-price estimates
Agriculture, forestry and fishing	Agriculture	**Benchmark years:** Periodic Censuses of Agriculture conducted by Stats SA. GDP estimates compiled by the National Department of Agriculture in collaboration with Stats SA. **Other years:** An annual survey of agriculture conducted by Stats SA. GDP estimates are compiled by the Department of Agriculture in collaboration with Stats SA. **Note:** Estimates from the census and survey results are verified against quarterly source data collected by the National Department of Agriculture. Estimates include the value of farm produce consumed by farmers for own account.	Information obtained from various marketing agents and other agricultural related organisations in respect of the value of production of field crops, horticulture and livestock. Expenditure data on intermediate goods are collected by the National Department of Agriculture from a number of manufacturers and associations, for *inter alia,* fertilisers, farm feed, dips and sprays, and fuel.	Nominal values of production and intermediate inputs are divided by appropriate price indices, compiled by the National Department of Agriculture.
	Forestry	**Benchmark years and other years:** Annual information obtained from the Department of Water and Forestry Affairs. Estimates of growing forests and own-account production are based on a research project at the University of Pretoria.	Judgemental, trend.	Base-year estimates are extrapolated using volumes of harvested timber and changes in standing timber inventories.
	Fishing	**Benchmark years and other years:** Information provided by the Marine Development Branch of the Department of Environmental Affairs and technical periodicals.	Same as for annual estimates for other years.	Base-year estimates are extrapolated using appropriate indices of the quantity of fish caught.
Mining and quarrying		**Benchmark years:** Periodic Censuses of Mining conducted by Stats SA. **Other years:** Monthly data on production and sales for the various sectors of the mining industry and the quarterly surveys of financial and labour statistics, conducted by Stats SA. Supplemented by working results of the Chamber of Mines in respect of the gold-mining industry and sample surveys conducted by the SA Reserve Bank.	Same as for annual estimates for other years.	Base-year estimates are extrapolated using appropriate indices of output quantities of various sectors of mining. Information obtained from the Minerals Bureau, Department of Mineral and Energy, Stats SA and the Chamber of Mines.
Manufacturing		**Benchmark years:** Periodic Censuses of Manufacturing conducted by Stats SA. **Other years:** Monthly data on production and sales, and quarterly surveys of financial and labour statistics conducted by Stats SA, supplemented by sample surveys conducted by the SA Reserve Bank.	Same as for annual estimates for other years.	Base-year estimates are extrapolated using appropriate indices of output quantities based on manufacturing sales at constant prices for the various subsectors of manufacturing.
Electricity, gas and water		**Benchmark and other years:** Annual statistics and financial statements obtained from ESKOM, the Water Boards and local authorities.	Monthly survey on generation and consumption of electricity conducted by Stats SA and supplemented by a quarterly survey conducted by the SA Reserve Bank.	Base-year estimates are extrapolated using appropriate indices of output quantities.
Construction		**Benchmark years:** Periodic Censuses of Construction conducted by Stats SA. **Other years:** Extrapolation of the benchmark year estimates of gross operating surplus according to the trend in gross domestic fixed investment of residential and non-residential buildings and construction works as compiled by the SA Reserve Bank. Labour remuneration is extrapolated according to the quarterly labour statistics of Stats SA. Aggregate estimates verified with Stats SA's monthly survey of building statistics.	Same as for annual estimates for other years.	Base-year estimates are extrapolated using the trend in real gross domestic fixed investment of residential and non-residential buildings and construction works. Verified by cementation sales quantities and a monthly survey of building statistics by Stats SA.

* See end of table for footnotes and list of abbreviations.

Sector	Subsector	Annual estimates	Quarterly estimates	Constant-price estimates
Wholesale and retail trade, catering and accommodation	Wholesale and retail trade (including motor trade)	**Benchmark years:** Censuses of Wholesale Trade, Commercial Agents and Allied Services; Retail Trade; and Motor Trade and Repair Services, conducted by Stats SA. For enterprises of general government, annual and quarterly surveys of local authorities, conducted by Stats SA, are used. **Other years:** Monthly surveys of turnover statistics of wholesale, retail and motor trade and quarterly labour statistics conducted by Stats SA, supplemented by financial statistics and sample surveys conducted by Stats SA and the SA Reserve Bank, respectively.	Same as for annual estimates for other years.	Base-year estimates are extrapolated using indices for wholesale, retail and motor sales quantities.
	Catering and accommodation	**Benchmark years:** Censuses of Catering and Accommodation Services and the Census of Licensed Restaurants, conducted by Stats SA. **Other years:** Extrapolation according to the trend of retail trade sales and trading statistics for hotels, conducted by Stats SA.	Same as for annual estimates for other years.	Base-year estimates are extrapolated using changes in indices for room and bed nights sales.
Transport, storage and communication		**Benchmark and other years:** Financial reports of Transnet, Telkom, SA Post Office; annual and quarterly surveys of local authorities conducted by Stats SA. Private transport benchmark estimates are obtained from Censuses of Transport and Allied Services, conducted by Stats SA. Estimates for in-between years of private transport are extrapolated according to the monthly surveys of road and rail transport of passengers and goods. Supplemented by individual studies such as for the taxi industry, the cellular networks and the Internet service providers.	Same as for annual estimates obtained quarterly from the various institutions. Supplemented by surveys conducted by the SA Reserve Bank.	Base-year estimates are extrapolated using appropriate indices of the volume of services rendered by the various institutions.
Financial intermediation, insurance, real estate and business services	Financial intermediation and insurance	**Benchmark and other years:** Annual and quarterly surveys conducted by the SA Reserve Bank among the various institutions in the private sector and information reported by public authorities and public corporations.	Same as for annual estimates.	Base-year estimates are extrapolated using appropriate indices, verified by nominal transactions divided by appropriate price indices.
	Real estate (including imputed rent on residential buildings) and business services	**Benchmark and other years:** Censuses of business services and the 1996 Population Census. Supplemented by individual studies such as for car rentals and the security industry.	The monthly surveys by Stats SA of buildings completed and price indices of rent. Judgemental estimates for business services.	Base-year estimates are extrapolated using real capital stock of residential buildings.
Community, social and personal services	Other services	**Benchmark and other years:** Periodic censuses of Social Services conducted by Stats SA.	Judgemental.	Nominal values are divided by relevant components of the CPI.
	General government services	**Benchmark years:** GFS analyses. **Other Years:** Main Budget and annual reports of the provincial and local authorities and extra-budgetary accounts. Gross operating surplus equals consumption of fixed capital at replacement values.	Quarterly surveys by Stats SA of employment, salaries and wages in the public sector. Gross operating surplus same as for annual estimates for other years.	Base-year estimates are extrapolated using an index of employment by general government.
	Other producers	**Benchmark and other years:** Censuses of relevant social services (such as welfare organisations), supplemented by the 1996 Population Census and annual reports of relevant non-profit institutions.	Judgemental. (Trend in remuneration of domestic servants is verified by taking into account the real capital stock of residential buildings).	Nominal values are divided by relevant components of the CPI and verified by the GDP deflator.

4.2 Gross domestic expenditure

Sector	Subsector	Annual estimates	Quarterly estimates	Constant-price estimates
Private consumption expenditure	**Durable, semi-durable and non-durable goods:**			
	Most goods (except subcomponents listed separately)	**Benchmark years:** Five-yearly survey of Income and Expenditure of Households conducted by Stats SA and intermittent surveys of household expenditure by BMR at Unisa. Estimates of main aggregates are compiled by the SA Reserve Bank using the average expenditure per household, population group and province multiplied by the number of households according to population census statistics. **Other years:** Annual information is equal to the sum of the quarterly estimates, verified against appropriated annual data sources available.	Base-year estimates are extrapolated using retail sales from monthly surveys by Stats SA and the Retailer Liaison Committee.	Nominal expenditure is divided by relevant components of the CPI or base-year estimates are extrapolated using quantities purchased. (Deflators verified against the relevant CPI components.)

Sector	Subsector	Annual estimates	Quarterly estimates	Constant-price estimates
Private consumption expenditure (continued)	**Personal transport equipment:**			
	New motor cars and minibuses	**Benchmark and other years:** Annual information on physical quantity of new motor vehicles sold times average retail price. Estimates are verified by registrations of new motor vehicles according to registrations among private consumers and other purchases. Sources of basic data are NAAMSA and NaTIS.	Same as for annual estimates.	Base-year estimates are extrapolated using appropriate indices of motor vehicles registered.
	Used cars	**Benchmark and other years:** Value added by used-car trade estimated for GDP; verified by registrations of used cars and trade margins provided by motor trade.	Same as for annual estimates.	Nominal values are divided by relevant components of the CPI.
	Food, beverages and tobacco:			
	All components	**Benchmark years:** Estimated by the National Department of Agriculture; verified by the five-yearly survey of Income and Expenditure of Households, surveys of retail sales and the input-output data. Estimates include farm produce consumed by farmers for own account. **Other years:** Estimates by the National Department of Agriculture verified by the sum of monthly surveys of retail sales by Stats SA and the Retailer Liaison Committee.	Same as for annual estimates.	Nominal expenditure is divided by relevant components of the CPI.
	Petroleum products:			
	Petrol, diesel and oil	**Benchmark and other years:** Quantities, supplied by petroleum companies, purchased and allocated among consumers and other purchasers, multiplied by an average retail price. Verified by the five-yearly survey of Income and Expenditure of Households and input-output estimates.	Same as for annual estimates.	Base-year estimates are extrapolated using physical quantities purchased. (Deflator verified by the CPI component.)
	Services:			
	Rent: space rent for owner-occupied and rent for tenant-occupied dwellings	**Benchmark years:** Population censuses and average annual rental obtained from Stats SA. **Other years:** Capital stock of residential buildings and average annual rental values.	Same method as annual; housing stock extrapolated by residential capital stock and average rental values.	Base-year estimates are extrapolated using real capital stock of residential buildings.
	Domestic services	**Benchmark:** Remuneration and weekly hours are multiplied by the number of workers using Stats SA's sample surveys of dwellings and information obtained from the five-yearly survey of Income and Expenditure of Households and the 1996 Population Census results for domestic workers. **Other years:** Sum of quarterly estimates.	Extrapolation of benchmark figures with a volume index of dwellings adjusted with the CPI component of domestic workers.	Base-year estimates are extrapolated using the volume index of dwellings. (Deflator verified by the appropriate CPI component.)
	Physicians, dentists, and other medical and professional services	**Benchmark years:** From the five-yearly survey of Income and Expenditure of Households and the annual report of the Registrar of Medical Schemes. Verified by independent studies on medical cost. **Other years:** Various indicators; retail sales of pharmaceuticals, patents and other medicines, population growth and data obtained from provincial hospitals.	Same as for annual estimates.	Nominal expenditure is divided by components of the CPI for medical and pharmaceutical products, hospital and doctor services.
	Transport and communication	**Benchmark years:** Expenditure on passenger and goods transport obtained from Transnet and Metrorail; expenditure on telephones, postage and other postal services supplied by Telkom and SA Post Office; expenditure on insurance from short-term insurers, according to the annual survey of insurers conducted by the SA Reserve Bank. Verified by the five-yearly survey of Income and Expenditure of Households. **Other years:** Base-year estimates are extrapolated by using information from Transnet and Metrorail, Telkom and SA Post Office, annual survey of short-term insurers and judgemental trend on taxis.	Same as for annual estimates.	Base-year estimates are extrapolated by using an index of number of passengers, a volume index of telephone and postage services and judgement on taxis and other transport, verified by petroleum sales. (Deflator verified by relevant CPI components.)

Sector	Subsector	Annual estimates	Quarterly estimates	Constant-price estimates
Private consumption expenditure (continued)	**Services: (continued)**			
	Entertainment, cultural and educational services	**Benchmark years:** Entertainment and recreational services: Expenditure on admission fees to theatres, cinemas, sports events, museums, etc. obtained from miscellaneous publications and other sources of information. Verified and supplemented by the five-yearly survey of Income and Expenditure of Households, for *inter alia*, hiring of television sets, videos and other recreational equipment, film development and photographic services and veterinary and other services for pets. Television licences paid annually, obtained from the SABC and SA Post Office. Education: Fees to schools, universities, etc. from published information on financial statistics at universities and technikons. **Other years:** Base-year estimates are extrapolated using GDP estimates and available quarterly data of certain services.	Various indicators, and information obtained from educational institutions, the SABC, Telkom and SA Post Office as well as judgement.	Nominal expenditure is divided by relevant elements of the educational component of the CPI.
	Miscellaneous services:			
	Restaurants, cafes, hotels and lodging	**Benchmark:** Five-yearly survey of Income and Expenditure of Households, verified by a monthly survey, hotels: trading statistics, conducted by Stats SA. **Other years:** Adding of quarterly estimates.	Extrapolation of benchmark figures with information obtained from a sample survey of hoteliers, published by Stats SA in Hotels: trading statistics.	Nominal expenditure on food and beverages is divided by relevant components of the CPI and extrapolation of accommodation, using the number of room nights sold at registered hotels.
	Personal care services by barbers, beauty shops, etc.	**Benchmark years:** Five-yearly survey of Income and Expenditure of Households. **Other years:** Adding of quarterly estimates.	Judgement; verified by growth in population.	Nominal expenditure is divided by the CPI for hairdressing services.
	Financial services	**Benchmark years:** Derived from financial intermediation services indirectly measured (FISIM) and estimates of other service charges made to calculate output for financial intermediation and long-term insurance services. **Other years:** Adding of quarterly figures.	Same as for benchmark estimates.	Nominal expenditure is divided by the CPI for services.
	Other services	**Benchmark years:** Five-yearly survey of Income and Expenditure of Households. **Other years:** Adding of quarterly figures.	Judgement; verified by relevant economic indicators.	Nominal expenditure is divided by the CPI for services.
	Consumption expenditure by non-residents in domestic market	Balance of payments data regarding travelling costs, tourist expenditure and remuneration of contract workers.	Same as for annual estimates.	Nominal expenditure is divided by the CPI.
	Direct purchases of resident households abroad	Balance of payments data regarding expenditure of resident households abroad.	Same as for annual estimates.	Nominal expenditure is divided by a weighted average price index of South Africa's major trading partners.
Consumption expenditure by general government	Expenditure on intermediate goods and services	**Benchmark years:** GFS analyses. **Other years:** GFS analyses and information on the general government received from Stats SA.	Extrapolated by using information obtained from the Financial Management System (FMS) of the general government and Exchequer issues obtained from the Department of Finance.	Nominal values are divided by a weighted average of relevant components of the PPI.
	Compensation of employees	**Benchmark years and other years:** Same as for intermediate goods and services.	Extrapolated by using information obtained from the Financial Management System of the general government received from the Department of Finance and quarterly surveys received from Stats SA.	Base-year estimates are extrapolated according to employment data obtained from Stats SA for central government, provincial governments, local authorities, and other statutory institutions.

Sector	Subsector	Annual estimates	Quarterly estimates	Constant-price estimates
Consumption expenditure by general government (continued)	Consumption of fixed capital	**Benchmark years and other years:** Allowances for depreciation of general government's buildings and structures estimated by the SA Reserve Bank.	Same as for annual estimates.	Allowance for depreciation of the real value of fixed capital stock.
	Sales of government services	**Benchmark years and other years:** Same as for intermediate goods and services.	Extrapolated by using information obtained from the Financial Management System of the general government received from the Department of Finance.	Nominal values are divided by a derived price deflator of intermediate inputs.
Gross fixed capital formation	**Private sector:**			
	Most fixed investment (except subcomponents listed separately)	**Benchmark years:** Five-yearly censuses conducted by Stats SA for the various sectors of the economy. **Other years:** Extrapolated or interpolated according to the results of quarterly sample surveys by the SA Reserve Bank and Stats SA of financial statistics of business enterprises. Verified by input-output estimates.	Extrapolated by using information from quarterly sample surveys of Stats SA; SA Reserve Bank surveys; and information collected by the National Department of Agriculture; and judgemental projections based on relevant time series.	Nominal values of fixed investment by type of assets are divided by appropriate price indices. Residential, non-residential and construction works are divided by separate weighted indices (derived from the triennial Census of Construction), compiled by the SA Reserve Bank. Transport equipment and machinery and other equipment are divided by weighted indices of relevant components of the production price index. Investment in agriculture is divided by weighted price indices obtained from relevant time series supplied by the National Department of Agriculture.
	Private residential buildings	**Benchmark years and other years:** Stats SA information on building plans passed and buildings completed.	Extrapolated by using the results of the monthly sample survey of Stats SA of buildings completed.	
	Leasing contracts	**Benchmark years and other years:** SA Reserve Bank's survey of financial institutions.	Same as for annual estimates.	
	Transfer costs	**Benchmark years and other years:** The sum of quarterly estimates of the transfer fees paid to general government, plus the agent and legal fees calculated as a percentage of the value of transactions in real estate.	Same as for annual estimates.	Nominal values are divided by the price index for residential buildings.
	Public corporations	**Benchmark years and other years:** Annual surveys of the corporations conducted by the SA Reserve Bank. Verified by the statistical survey on Actual and expected capital expenditure of the public sector and Expenditure of the general government, conducted by Stats SA.	Same as for annual estimates.	Same as for private sector.
	Public authorities	**Benchmark years and other years:** Information obtained from GFS analyses.	Same as for annual estimates.	Same as for private sector.
Change in inventories	Industrial and commercial inventories and other non-farm industries	**Benchmark years:** Book value of inventories (adjusted by inventory revaluation) obtained from the censuses of Stats SA and surveys by the SA Reserve Bank among public corporations and business enterprises of general government. **Other years:** Stats SA and SA Reserve Bank quarterly surveys. Livestock and gold require no valuation adjustment; changes are calculated from physical quantities and average current prices.	Same as for annual estimates; based on information obtained from quarterly financial surveys conducted by Stats SA and the SA Reserve Bank.	Book value of inventories is divided by the production price index, or specific price indices, such as for diamond stocks-in-trade.
	Agricultural stocks-in-trade	Quarterly statistics from the various marketing agents and SAGIS.	Same as for annual estimates.	Base-year values are extrapolated by using the quarterly change in physical quantities.

1. The production approach is applied for the benchmark years. When the latter method is used, the GDP is estimated as the difference between the values of production and outlays on intermediate goods. For the quarterly estimates a combination of the production approach and the income method is used. For the latter a distinction is made between compensation of employees and gross operating surplus. The estimates for the gross domestic product by kind of economic activity at constant prices, using the extrapolation method of base-year estimates (by appropriated volume indices) have been supplemented, since 1993, by deflating output and intermediate input for the relevant sectors.

2. Annual and quarterly estimates are extended to incorporate the activities of the informal sector.

Abbreviations used in Section 4

BMR - Bureau of Market Research
CPI - Consumer price index
FMS - Financial Management System
GDP - Gross domestic product
GFS - Government Finance Statistics
NAAMSA - National Association of Automobile Manufacturers of South Africa
NaTIS - National Traffic Information System
PPI - Production price index
SABC - South African Broadcasting Corporation
Stats SA - Statistics South Africa
SAGIS - South African Grain Institute

5. The integrated economic accounts

5.1 Introduction

The main objective of the 1993 SNA is to provide a comprehensive conceptual and accounting framework which can be used to create a macroeconomic database suitable for analysing and evaluating the performance of an economy. The detailed *integrated economic accounts* (IEA) introduced by the 1993 SNA are at the centre of the accounting framework. They provide an overall view of a given economy.

The SNA records flows and stocks in an ordered set of accounts describing the economic cycle from the generation of income, through its distribution and redistribution and finally to its accumulation in the form of assets. The structured recording of transactions according to a logical analysis of economic life provides the aggregates required for the study of an industry, an institutional sector or the total economy. The breakdown of the IEA accounts, as defined in the 1993 SNA, was designed to reveal the most significant economic information.

The central framework of the 1993 SNA contains the following important elements:

- A full sequence of accounts for institutional sectors and the total economy (the sum of all institutional sectors).
- A full sequence of accounts for the rest of the world.
- Transactions accounts of which the goods and services account are of particular importance.

Table 6 gives a list of the integrated accounts with an indication of the balancing item of each account. It is evident from the table that there are three groups of accounts for the institutional sectors as well as the rest of the world. In addition, as mentioned earlier, there are also the transactions accounts.

The *current accounts (Accounts I and II)* deal firstly with production and secondly with the generation, distribution and use of income. These are current transactions that either increase (resource) or decrease (uses) the economic value of a unit, sector or the total economy. Saving is the difference between all resources and uses. It represents the changes in net worth resulting from current transactions. Resources and uses are distinguished for each account and the opening balance for each account, shown as a resource, is the balancing item of the previous account. "Balancing item" is a term used to describe those entries in any specific account that cannot be measured independently of the other entries on that account. They encapsulate vital information and include some of the most important entries in the accounts enumerated in Section 6. The end result of the current accounts is the balancing item of the use of income accounts, which is also equal to saving – in other words, that part of income originating in production which is not used for final consumption.

Table 6. Summary of the 1993 SNA integrated economic accounts

Accounts	Balancing items and aggregates
Full sequence of accounts for institutional sectors	
Current accounts	
Production account	Gross domestic product (GDP) for the economy and gross value added for the sectors
Generation and allocation of income accounts	Compensation of employees, taxes less subsidies on production and imports, operating surplus, interest and dividends, gross national income (GNI)
Distribution of income accounts	Taxes on income and wealth, current transfers, gross disposable income (GDI)
Use of income accounts	Consumption and saving
Accumulation accounts	
Capital account	Gross fixed capital formation, capital transfers, changes in inventories, net lending or borrowing
Financial account	Net acquisition of financial assets, net incurrence of liabilities
Other changes in volume of assets account	Catastrophic losses, uncompensated seizures, economic appearance and disappearance of assets, changes in net worth due to these factors
Revaluation account	Holding (capital) gains and losses, changes in net worth owing to holding gains and losses
Balance sheets	
Opening balance sheet	Non-financial assets, financial assets, liabilities and net worth
Changes in balance sheet	Changes in net worth reflected in accumulation accounts
Closing balance sheet	Non-financial assets, financial assets, liabilities and net worth
Rest of the world accounts	
Current accounts	
External account of goods and services	External balance of goods and services
External account of primary incomes and current transfers	Current external balance
Accumulation accounts	
External capital account	Net lending/borrowing of the nation
External financial account	Net lending/borrowing of the nation
External account for other changes in assets	Changes in net worth
Balance sheets	
External opening balance sheet	Net external financial position of the nation
External changes in balance sheet	Changes in net external financial position of the nation
External closing balance sheet	Net external financial position of the nation
Transactions accounts	
Goods and services account	

These accounts are normally compiled separately for the *institutional sectors* of the economy. The 1993 SNA defines an institutional unit as "an economic entity that is capable, in its own right, of owning assets, incurring liabilities and engaging in economic activities and transactions with other entities".

The *accumulation accounts (Account III)* represent flow accounts which record all transactions and other changes in assets, liabilities and net worth. This is equivalent to all changes between two balance sheets. Saving is the link to the current accounts.

The *balance sheets (Account IV)* show the values of the stocks of assets and liabilities held by institutional units or sectors at the beginning and end of an accounting period. Changes between the opening and closing balance sheets result from the transactions and other flows recorded in the accumulation accounts, including changes in the classification of assets and liabilities.

The SNA does not require that accounts be compiled for economic activities by resident units conducted in the rest of the world. However, in order to judge the economic behaviour of resident units, it is necessary to record all transactions between resident and non-resident units. These transactions are grouped together in one account, namely the *rest of the world account*.

A *transactions account* brings together all transactions of the same type in a dummy account. The transactions account for interest, for example, shows the interest receivable by the different institutional sectors and the rest of the world on the debit side, and the interest payable by the same sectors and the rest of the world on the credit side. Among the transactions accounts, however, the *goods and services account (Account 0)* is of particular importance. This account shows how the resources are balanced against the uses for the total economy.

The 1993 SNA groups the resident institutional units that make up the total economy into five mutually exclusive sectors:

- The non-financial corporate sector;
- the financial corporate sector;
- the general government sector;
- the household sector; and
- the non-profit institutions serving households (NPISHs) sector.

See Table 1 in Section 2 for a detailed institutional classification (NPISHs incorporated into the household sector) of the sectors and the units included in each sector.

A complete set of accounts, including balance sheets, can only be compiled for institutional units and sectors, and for the rest of the world. In fact, one criterion for an institutional unit is that it must be possible, at least in principle, to compile a full sequence of accounts. Only the production and generation of income accounts can be compiled for establishments and industries and provide the format for the calculation of gross domestic product by activity.

The SNA applies techniques of business accounting. One feature is to present the accounts in a T-shape, where the left-hand side of a T-account is called debit and the right-hand side credit. The terminology used in the accounts can be illustrated as follows:

	Debit	Credit
Current accounts	Uses	Resources
Accumulation accounts	Changes in assets	Changes in liabilities and net worth
Balance sheets	Assets	Liabilities and net worth

Business accounting is based on the principle of double entry whereby one transaction results in two matching entries. However, since national accounts record transactions for the two parties involved (if there are two parties), one transaction gives rise to a quadruple entry. Financial accounts, however, must be compiled in order to take full advantage of the quadruple entry principle.

The following subsection sets out a brief description of the theoretical concepts of the IEA, while subsection 5.3 gives an example of the IEA according to the national accounts data for 1995.

5.2 Conceptual framework

5.2.1 Current accounts

The different current accounts dealing with production, distribution of income and use of income are reviewed below.

The *production account (Account I)*, which is the first in the sequence of accounts, records the production (output) of goods and services, as a resource, and the utilisation of goods and services (intermediate consumption), as a use, to establish, as the difference, the gross value added. The wear and tear of fixed capital in the production process is recorded as a separate item (consumption of fixed capital). If this is subtracted as a use,

Account I Production account

I.1 Production account for an institutional sector or industry

Uses	Resources
Intermediate consumption	Output at basic prices
Gross value added	
Consumption of fixed capital	
Net value added	

I.2 Production account for the total economy

Uses	Resources
Intermediate consumption	Output at basic prices Taxes on products Subsidies on products (-)
Gross domestic product	
Consumption of fixed capital	
Net domestic product	

the balancing item, or value added, is measured on a net basis. Production accounts can be compiled for institutional units or sectors and establishments and industries. As shown in Account I.1, output at basic prices which exclude all taxes on products and include all subsidies on products, is recorded for an institutional sector or industry. The *production account (Account I.2)* for the total economy, however, includes taxes on products and subsidies on products (a negative item).

The distribution and use of income accounts (Account II) consist of four main accounts which display the process of distribution and use of income. The first stage in this process is the *primary distribution of income accounts,* which is further divided into two accounts, a *generation of income account* and an *allocation of primary income account*. Primary incomes are incomes that are payable out of the value added that is created in production. They accrue to institutional units as a result of their involvement in production, ownership of assets that may be needed in production or, in the case of government, as a result of levying taxes that are payable out of the value added. The *generation of income account* contains only one item on the resources side, namely value added, which is the balancing item brought forward from the production account. On the uses side the components of value added are recorded, namely compensation of employees, taxes on production and imports, subsidies, and

Account II Distribution and use of income accounts
II.1 Primary distribution of income accounts
II.1.1 Generation of income account

Uses	Resources
Compensation of employees Taxes on production and imports Taxes on products Other taxes on production Subsidies (-) Subsidies on products Other subsidies on production	*Value added**
Operating surplus/mixed income	

* For the total economy this item corresponds to domestic product, gross or net.

II.1.2 Allocation of primary income account

Uses	Resources
Property income	*Operating surplus/mixed income* Compensation of employees Taxes on production and imports Taxes on products Other taxes on production Subsidies (-) Subsidies on products Other subsidies on production Property income
*Balance of primary incomes**	

* For the total economy this item corresponds to national income, gross or net.

operating surplus/mixed income[4], gross or net. Taxes and subsidies on products constitute part of the domestic product but not of the values added by institutional sectors and industries. These taxes therefore only appear in the generation of income account for the total economy. In addition, the *allocation of primary income account* can be subdivided to show entrepreneurial income and other primary income (see Section 6).

The *allocation of primary income account* shows the resident units and institutional sectors as the recipients, rather than the producers of primary income. It demonstrates the extent to which operating surpluses are distributed (for example by dividends) to the owners of the enterprise. In addition, it shows the property income received by an owner of a financial asset in return for providing funds to another unit. Transactions in primary incomes also occur with the rest of the world. The balancing item of the allocation of primary income account is the balance of primary incomes. The total of this balance for all institutional sectors is equal to national income, gross or net. Although subsidies are incomes (resources) for producers, they are recorded as a use with a negative sign on the debit side of the generation of income account. Similarly, subsidies are expenditures for government, recorded as negative incomes on the resources side of the allocation of primary income account. The reason for this is that subsidies can be regarded as negative taxes on production and imports.

The *secondary distribution of income account* shows how the balance of primary incomes is further redistributed by transactions in current transfers, such as taxes on income and social contributions, among resident institutional sectors and between them and the rest of the world. This redistribution of income represents the second stage in the process of income distribution, ending in the disposable income of institutional sectors. This balancing item can be interpreted as the maximum amount that a unit can spend

4) Operating surplus – mainly used for income generated by incorporated business enterprises. Mixed income – mainly used for income generated by non-incorporated business enterprises in the household sector.

on consumption goods and services without disposing of its assets or increasing its liabilities. The total of the disposable income of all institutional sectors is equal to the national disposable income, gross or net.

II.2 Secondary distribution of income account

Uses	Resources
Current taxes on income, wealth, etc.	*Balance of primary incomes*[1]
Social contributions	Current taxes on income, wealth, etc.
Social benefits[2]	Social contributions
Other current transfers[3]	Social benefits[2]
	Other current transfers[3]
Disposable income[4]	

1. For the total economy this item corresponds to national income, gross or net.
2. Other than social transfers in kind, for example civil pensions and unemployment benefits.
3. Contributions to and receipts from life and non-life insurance.
4. For the total economy this item corresponds to national disposable income, gross or net.

As a third stage, the *redistribution of income in kind account* shows the tertiary distribution of income through social transfers in kind. Social transfers in kind (for example educational and health services) are receivable by the household sector and payable by general government and non-profit institutions serving households. This account only relates to the transfer of goods and services from government and NPISHs to the household sector. It has nothing to do with the income in kind which is part of the remuneration of employees. The purpose of the account is to give a more complete measure of household income and to facilitate international comparisons and comparisons over time when social and economic arrangements differ or change. The balancing item of the redistribution of income is adjusted disposable income. The account depicts a redistribution of disposable income and therefore total adjusted disposable income is also equal to national disposable income.

II.3 Redistribution of income in kind account

Uses	Resources
Social transfers in kind	*Disposable income*
	Social transfers in kind
*Adjusted disposable income**	

* For the total economy this item corresponds to national disposable income, gross or net.

The fourth and last stage in the compilation of the current accounts is shown in the *use of income account.* The purpose of this account is to show the allocation of disposable income of households, general government and non-profit institutions between final consumption and saving. There are two versions of the account. They focus on the alternative concepts of disposable income and their related consumption concepts. The first account focuses on disposable income and final consumption expenditure and the second account on adjusted disposable income and actual consumption, which incorporates the total value of the individual consumption of goods and services required by institutional sectors. The adjustment for the change in net equity of households on pension funds, is a necessary item to ensure that any excess of pension contributions over pension receipts does not affect household saving. As was explained in the *secondary distribution of income account,* contributions to and pensions received from private funded schemes are treated as current transfers that affect disposable income. However, this should be seen as the acquisition and disposal of financial assets, as the pension schemes are considered as being owned by households. Therefore it is necessary to add back pension contributions to, and subtract pension receipts from, household disposable income, so that measured saving reflects any change in households' net equity in pension funds. The balancing item, namely saving, is the same in the two versions of the *use of income account.*

II.4 Use of income account

II.4.1 Use of disposable income account

Uses	Resources
Final consumption expenditure	*Disposable income**
Adjustment for the change in net equity of households on pension funds	Adjustment for the change in net equity of households on pension funds
Saving	

* For the total economy this item corresponds to national disposable income, gross or net.

II.4.2 Use of adjusted disposable income account

Uses	Resources
Actual final consumption	*Adjusted disposable income**
Adjustment for the change in net equity of households on pension funds	Adjustment for the change in net equity of households on pension funds
Saving	

* For the total economy this item corresponds to national disposable income, gross or net.

The balancing item resulting from the complete set of income accounts, i.e. saving, is carried forward to the *capital account*, which forms part of the *accumulation accounts.*

5.2.2 Accumulation accounts

The *accumulation accounts (Account III)* record changes in assets and liabilities during the accounting period.

The *capital account* records two main types of transactions. Acquisitions less disposals of non-financial assets by resident units are recorded on the left-hand side of the account. The right-hand side of the account measures the change in net worth due to saving (final balancing item in the current accounts) and capital transfers. The capital account makes it possible to determine the extent to which acquisitions less disposals of non-financial assets have been financed out of saving and by capital transfers. It shows a net lending (+) corresponding to the amount available to a unit or sector for financing, directly or indirectly, other units or sectors, or a net borrowing (-) corresponding to the amount which a unit or sector is obliged to borrow from other units or sectors.

Account III Accumulation accounts

III.1 Capital account

Changes in assets	Changes in liabilities and net worth
Gross fixed capital formation	*Saving, net*
Consumption of fixed capital (-)	
Change in inventories	Capital transfers receivable (+)
Acquisitions less disposals of valuables	Capital transfers payable (-)
Acquisitions less disposals of non-produced non-financial assets	*Changes in net worth due to saving and capital transfers*
Net lending (+)/net borrowing (-)	

The *financial account* records transactions in financial instruments. The balancing item is again net lending (+) or net borrowing (-) and, in theory, it is exactly the same as in the capital account, but derived in a different way from another category of data (monetary and financial statistics).

The *other changes in assets accounts* consist of two subaccounts. The first, namely the *other changes in volume of assets account,* covers changes in assets, liabilities and net worth which are due to factors other than the accumulation transactions recorded in the previous group of accounts. Examples are discoveries or depletion of subsoil resources, destruction by political events, such as wars, or by natural catastrophes, such as earthquakes.

The second subaccount, i.e. the *revaluation account,* records the changes in the value of assets and liabilities that result from changes in their prices, with "changes in net worth due to nominal holding gains/losses" as the balancing item. In this case only the value of assets and liabilities is adjusted, not their volume. The last-mentioned account is further subdivided into two accounts in order to separate real holding gains/losses in both financial and non-financial assets/liabilities from neutral holding gains/losses. A neutral gain is defined as the value of the holding gain that would accrue if the price of the asset changed in the same proportion as the general price level. The difference between the nominal holding gains/losses (Account III.3.2) and the neutral holding gains/losses (Account III.3.2.1) is called real holding gains/losses and is shown in Account III.3.2.2.

III.2 Financial account

Changes in assets	Changes in liabilities and net worth
Net acquisition of financial assets:	Net incurrence of liabilities:
Monetary gold and SDRs	
Currency and deposits	Currency and deposits
Securities other than shares	Securities other than shares
Loans	Loans
Shares and other equity	Shares and other equity
Insurance technical reserves	Insurance technical reserves
Other accounts receivable	Other accounts payable
	Net lending (+)/net borrowing (-)

III.3 Other changes in assets accounts

III.3.1 Other changes in volume of assets account

Changes in assets	Changes in liabilities and net worth
Non-financial assets	Liabilities
Produced assets	Catastrophic losses
Economic appearance of produced assets	Uncompensated seizures
Catastrophic losses	Other volume changes in financial assets and liabilities
Uncompensated seizures	Changes in classifications and structure
Other volume changes in non-financial assets	
Changes in classifications and structure	
Non-produced assets	
Economic appearance of non-produced assets	
Natural growth of non-cultivated biological resources	
Economic disappearance of non-produced assets	
Catastrophic losses	
Uncompensated seizures	
Other volume changes in non-financial assets	
Changes in classifications and structure	
Financial assets	
Catastrophic losses	
Uncompensated seizures	
Other volume changes in financial assets and liabilities	
Changes in classifications and structure	
	Changes in net worth due to other changes in volume of assets

III.3.2 Revaluation account

Changes in assets	Changes in liabilities and net worth
Nominal holding gains (+)/ losses (-):	Nominal holding gains (-)/ losses (+):
Non-financial assets	Liabilities
Produced assets	
Non-produced assets	
Financial assets	
	Changes in net worth due to nominal holding gains/losses

III.3.2.1 Neutral holding gains/losses

Changes in assets	Changes in liabilities and net worth
Neutral holding gains (+)/ losses (-):	Neutral holding gains (-)/ losses (+):
Non-financial assets	Liabilities
Produced assets	
Non-produced assets	
Financial assets	
	Changes in net worth due to neutral holding gains/losses

III.3.2.2 Real holding gains/losses

Changes in assets	Changes in liabilities and net worth
Real holding gains (+)/ losses (-):	Real holding gains (-)/ losses (+):
Non-financial assets	Liabilities
Produced assets	
Non-produced assets	
Financial assets	
	Changes in net worth due to real holding gains/losses

5.2.3 Balance sheets

The *balance sheets* record the stocks of assets and liabilities at the beginning *(opening balance sheet)* and at the end of the accounting period *(closing balance sheet)*. In addition there is a *changes in balance sheet* that records the sum of the changes in assets and liabilities between the opening and closing balance. These changes constitute the sums of changes in assets and liabilities derived from the accumulation accounts. The assets are displayed on the left-hand side of the account and liabilities and net worth on the right-hand side. Valuation is at the prices prevailing on the date when the balance sheet is established. Net worth, the difference between assets and liabilities, is the balancing item of the balance sheet.

Account IV Balance sheets

IV.1 Opening balance sheet

Assets	Liabilities and net worth
Non-financial assets	Liabilities
Produced assets	
Non-produced assets	
Financial assets	
	Net worth

IV.2 Changes in balance sheet

Assets	Liabilities and net worth
Total changes in assets	Total changes in liabilities
Non-financial assets	Liabilities
Produced assets	
Non-produced assets	
Financial assets	
	*Total changes in net worth**

* Changes in net worth due to saving and capital transfers, other changes in volume of assets and nominal holding gains/losses.

IV.3 Closing balance sheet

Assets	Liabilities and net worth
Non-financial assets	Liabilities
Produced assets	
Non-produced assets	
Financial assets	
	Net worth

5.2.4 Rest of the world account

Finally, not all transactors and holders of assets and liabilities are resident institutional units of a given economy.

Account V Rest of the world account

V.1 External account of goods and services

Uses	Resources
Exports of goods and services	Imports of goods and services
External balance of goods and services	

V.2 External account of primary incomes and current transfers

Uses	Resources
Compensation of employees Taxes less subsidies on production and imports Property income Current taxes on income, wealth, etc. Social contributions and benefits Other current transfers Adjustments for the change in net equity of households on pension funds	*External balance of goods and services* Compensation of employees Taxes less subsidies on production and imports Property income Current taxes on income, wealth, etc. Social contributions and benefits Other current transfers Adjustments for the change in net equity of households on pension funds
Current external balance	

V.3 External accumulation accounts

V.3.1 Capital account

Changes in assets	Changes in liabilities and net worth

V.3.3.2 Revaluation account

Changes in assets	Changes in liabilities and net worth
Nominal holding gains (+)/losses (-): Neutral holding gains (+)/losses (-) Real holding gains (+)/losses (-) Non-produced assets Financial assets	Nominal holding gains (-)/losses (+): Neutral holding gains (+)/losses (-): Real holdings gains (+)/losses (-): Liabilities *Changes in net worth due to nominal holding gains/losses* *Changes in net worth due to neutral holding gains/losses* *Changes in net worth due to real holding gains/losses*

V.4 External assets and liabilities account

V.4.1 Opening balance sheet

Assets	Liabilities and net worth
Non-financial assets Financial assets	Liabilities *Net worth*

V.4.2 Changes in balance sheet

Assets	Liabilities and net worth
Total changes in assets	Total changes in liabilities
Non-financial assets	Liabilities
Financial assets	
	*Total changes in net worth**

* Changes in net worth due to saving and capital transfers, other changes in volume of assets and nominal gains/losses.

V.4.3 Closing balance sheet

Assets	Liabilities and net worth
Non-financial assets	Liabilities
Financial assets	
	Net worth

Therefore, in order for the System to be closed, an additional account must be provided to capture the full range of transactions that take place between the total economy and the rest of the world. This account is known as the *rest of the world account* or *external transactions account (Account V).* The rest of the world account (see Section 6) is established from the point of view of the rest of the world so that a resource for the rest of the world is a use for the home economy and *vice versa.* A positive balancing item indicates a surplus for the rest of the world and a deficit for the home economy, and *vice versa* if the balancing item is negative.

5.2.5 Transactions accounts

The integrated economic accounts provide information for the calculation of the gross domestic product according to the production, income and demand methods. The last-mentioned approach, namely to calculate gross domestic product from the expenditure (demand) side, can best be illustrated in the *goods and services account (Account 0).* This account, which is an example of a *transactions account,* gives a global balance of transactions in goods and services. It indicates the total resources in terms of output and imports for the economy as a whole, and the use of goods and services in terms of intermediate consumption, final consumption, gross capital formation and exports.

Account 0 Goods and services account

Resources	Uses
Output	Intermediate consumption
Imports of goods and services	Final consumption expenditure/ actual final consumption
Taxes on products	Gross capital formation
Subsidies on products (-)	Gross fixed capital formation
	Change in inventories
	Acquisitions less disposals of valuables
	Exports of goods and services

5.3 Implementation of the integrated accounts

In this subsection, an example is given of the national accounts of South Africa for the year 1995. The compilation of the data is illustrated according to the IEA principles from the *production account* to the *capital account.* However, since all details are not currently available, a direct comparison with the theoretical framework regarding all possible entries is not possible.

6. The accounting framework of the 1993 SNA

The accounting framework of the 1993 SNA is presented in the following two pages. The diagram reflecting the structure of the accounts gives a synopsis of the flow of transactions for the economy as a whole and the sequence of transactions in the rest of the world account. These transactions are recorded in the newly developed integrated accounts, discussed in Section 5.

In the first part of the diagram the outlay (for each institutional sector) of the *current accounts* shows the flow of transactions/activities in goods and services from production and expenditure through to saving.

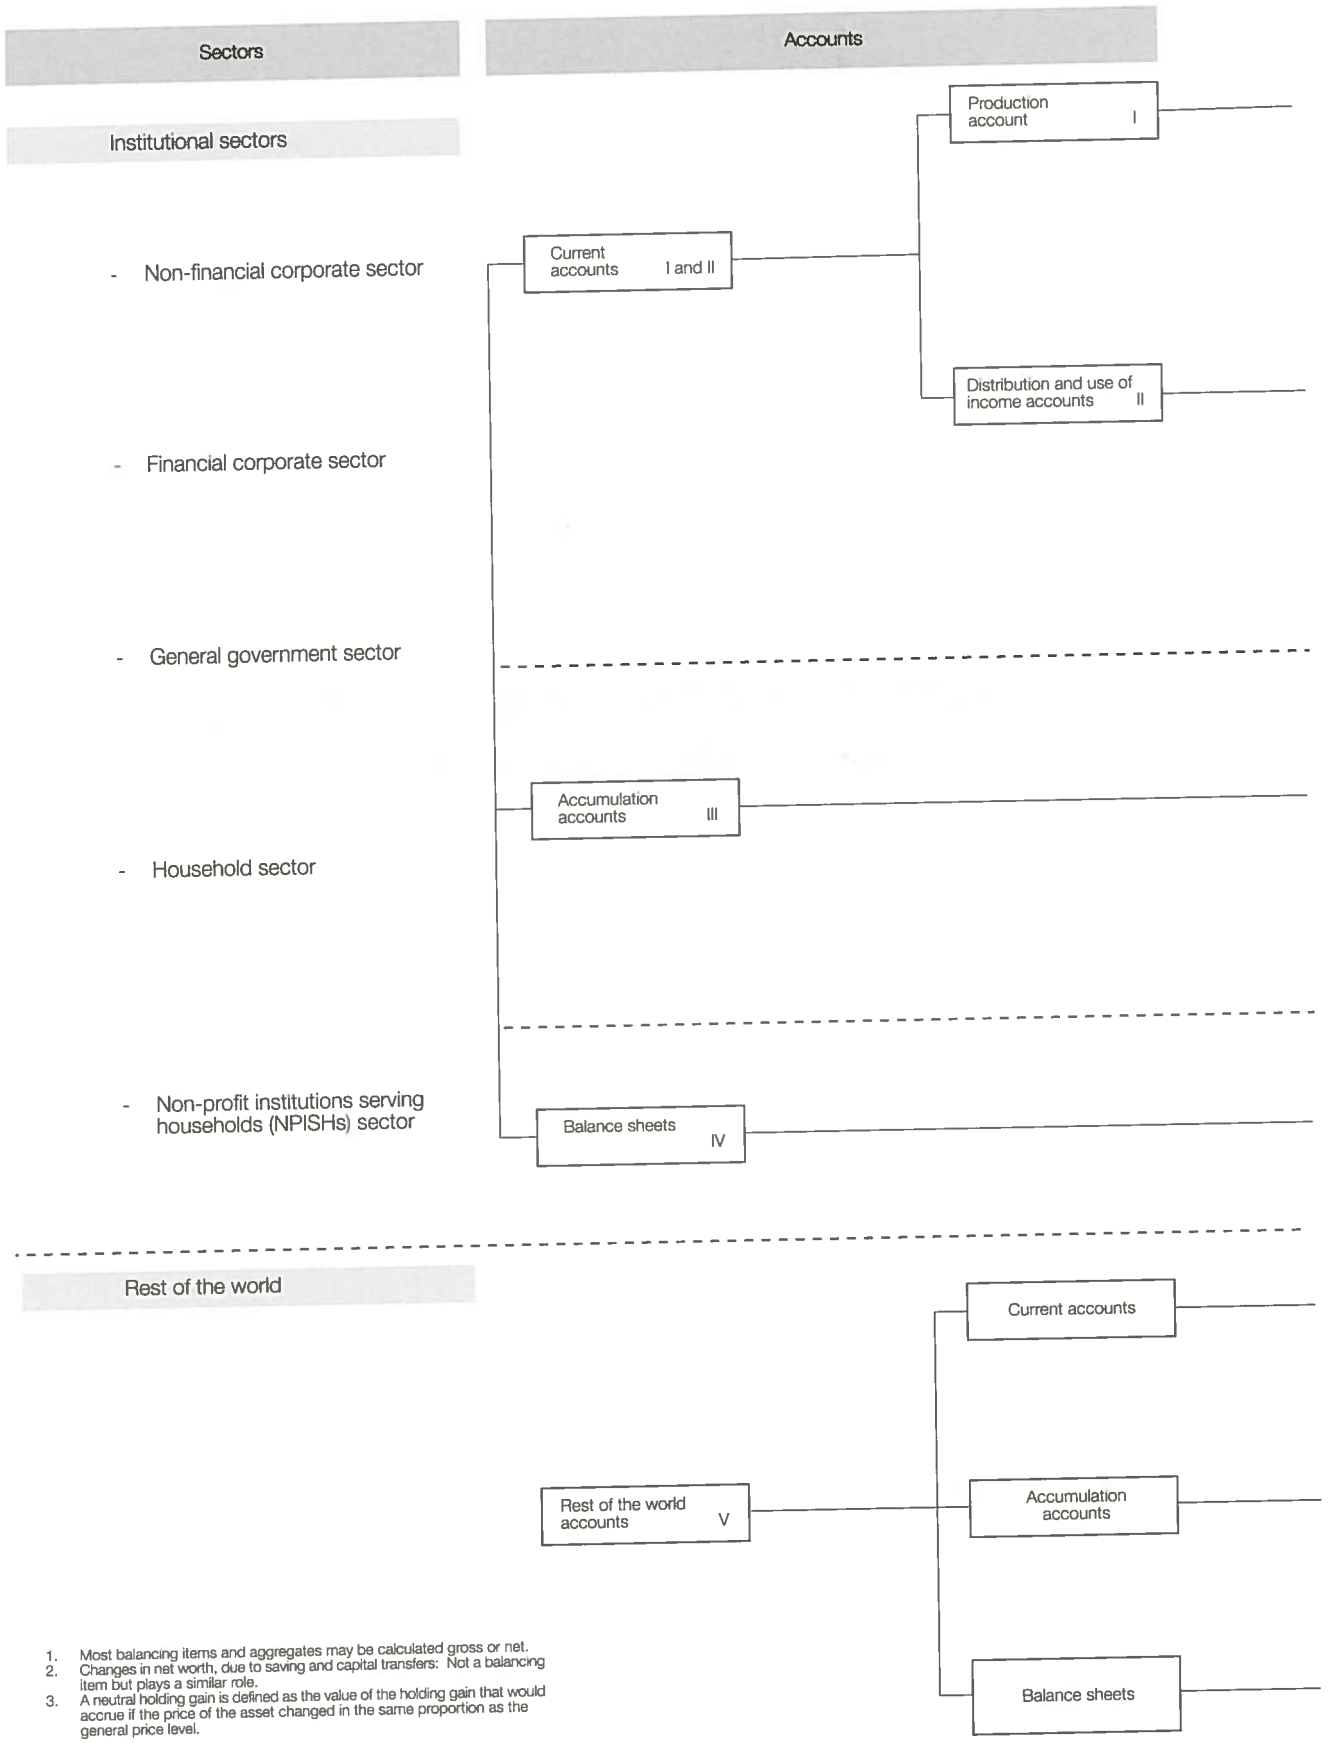
The *accumulation accounts* record the capital and financial transactions. In addition, these sets of accounts also display the changes in assets and revaluation to capture holding gains or losses. Net lending or borrowing for each institutional sector and the economy as a whole are derived from these accounts.

The next set of accounts are the *balance sheets*, reflecting the developments for assets and liabilities per institutional sector and the total economy. From the balance sheets it is also possible to calculate the net worth of the various sectors of the economy and the country as a whole.

Finally, the accounts for the *rest of the world* give a summary of the flows of goods and services, including financial and capital transactions between the resident country and the rest of the world.

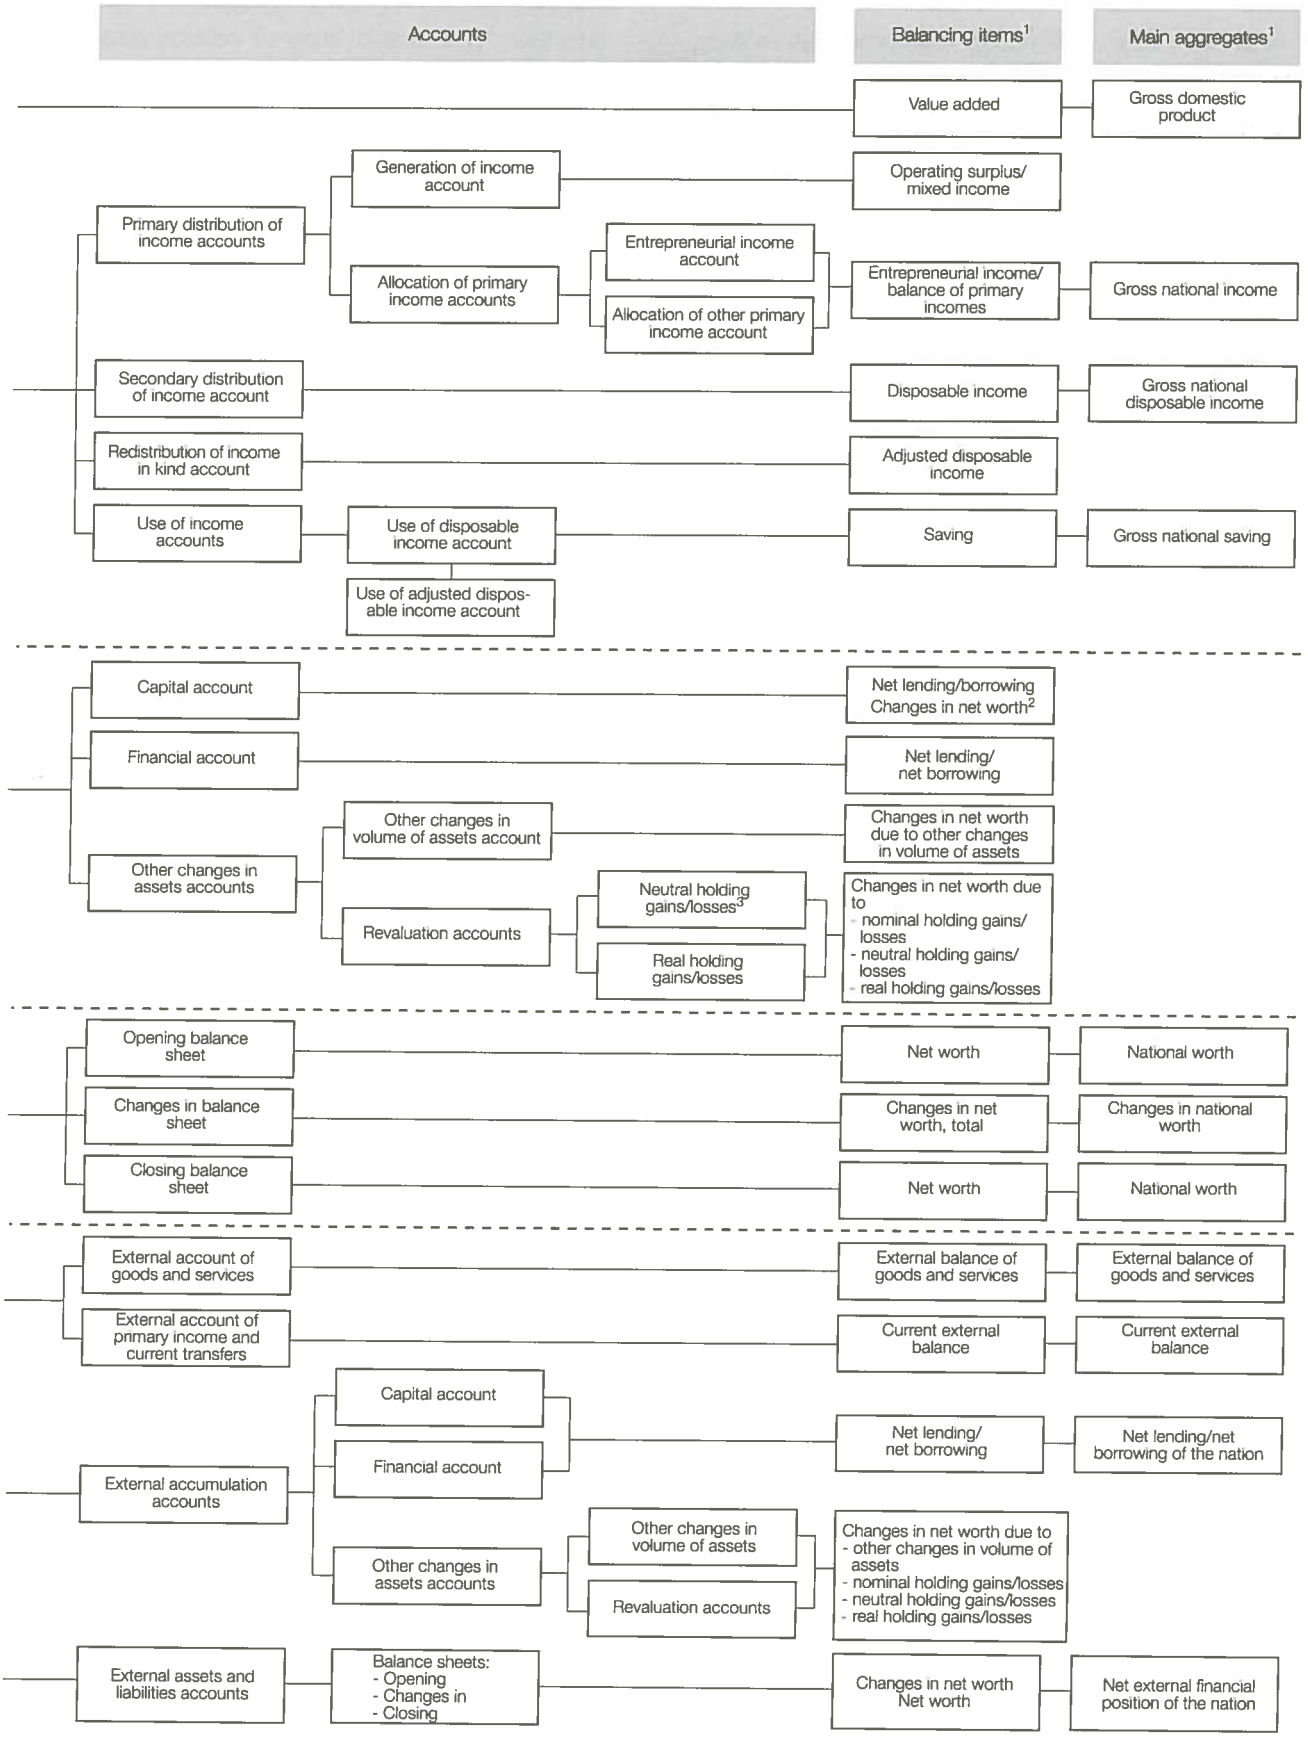
STRUCTURE OF THE 1993 SYSTEM OF NATIONAL ACCOUNTS

STRUCTURE OF THE 1993 SYSTEM OF NATIONAL ACCOUNTS



1. Most balancing items and aggregates may be calculated gross or net.
2. Changes in net worth, due to saving and capital transfers: Not a balancing item but plays a similar role.
3. A neutral holding gain is defined as the value of the holding gain that would accrue if the price of the asset changed in the same proportion as the general price level.

STRUCTURE OF THE 1993 SYSTEM OF NATIONAL ACCOUNTS



7. Key changes according to the 1993 SNA

The 1993 SNA was unanimously recommended to the United Nations Economic and Social Council by its Statistical Commission in February 1993. The Council, in turn, recommended to all member states that they use the SNA as the international standard for the compilation of their national accounts statistics and the development of internationally comparable data. The purpose of this section is to give a brief summary of the major changes contained in the 1993 SNA.

The 1993 SNA reflects several major changes in the global economic environment over the past two and a half decades. Among these are

- the greater concern about inflation which the SNA addresses through the development of a separate revaluation account for assets and liabilities;
- changes in government operations, which have led to improved measures of consumption;
- the considerable increase in the importance of service activities; and
- the innovations in financial instruments, institutions and markets, which the SNA addresses by providing new criteria for defining financial enterprises, and a thorough treatment of financial instruments and transactions.

A major effort has also been made to harmonise balance of payments concepts and measures with the relevant SNA concepts and measures. *The Manual on Government Finance Statistics* is being revised and a new *Manual on Monetary and Financial Statistics* is being developed. In both cases, harmonisation with the 1993 SNA is a major guiding principle.

Together with the above-mentioned features, the 1993 SNA provides clarification on several issues, such as the inclusion of illegal transactions in the accounts and the use of annual chain indices to compile an integrated set of price and volume measures. Finally, recognising the wide spectrum of economic conditions and institutional arrangements in different countries, the framework of the System is devised to be applicable to both developed and developing countries.

Some of the important revisions of the 1993 SNA are grouped together in the following subsections.[5]

7.1 Revisions of the accounting structure

- The production account of the 1968 SNA is divided into two accounts, namely a production account to show value added as an explicit balancing item, and a generation of income account showing the various charges against value added, such as compensation of employees and the operating surplus.
- Introduction of production accounts for all sectors and the cross-classification of intermediate expenses, value added and gross output for all institutional sectors and industries.
- The group of distribution and use of income accounts of the 1993 SNA incorporates the income and outlay accounts as in the 1968 SNA.
- The integration of the income and other flow accounts with balance sheets, and the creation of new balancing items.
- The capital finance account is divided to show a separate capital account and financial account.

7.2 Revisions of sectoral classifications

- In respect of non-financial enterprises, a distinction should be made between public corporations, national private corporations and foreign-controlled corporations. A public corporation is one controlled by the government, whereas foreign-controlled enterprises are defined as enterprises subject to control by non-residents. Although the 1968 SNA distinguished between public and private enterprises, it did not distinguish between resident enterprises that are subject to foreign control and those that are not.
- In a new definition of the financial sector, financial auxiliaries/units engaged primarily in activities that facilitate financial intermediation – are included in the financial corporate sector, but holding companies that control mainly non-financial subsidiaries are excluded. Financial auxiliaries consist of corporations such as security brokers, loan brokers and corporations which arrange hedging instruments such as swaps, options and futures contracts.
- Provision is made for separately identifying the non-profit institutions serving households as a full sector of the System.
- All financial non-incorporated enterprises owned by households are classified in the household sector. Under the 1968 SNA these were treated as quasi-corporations.
- Government employee pension schemes are classified in the financial sector.
- Households are grouped into subsectors according to the nature of their largest source of income. The following subsectors are consequently distinguished:
    - Employers, with principal income accruing to the owners of household non-incorporated enterprises with paid employees;
    - own-account workers, primarily earning mixed incomes, which implicitly contain an element of remuneration for work done by the owner and an entrepreneurship return, accruing to the owners of household non-incorporated enterprises without paid employees;
    - employees, principally earning compensation of employees; and

5) For a full discussion of the changes in the 1993 SNA and the main differences between the *old* and the *new* Systems, see the System of National Accounts 1993, pp. 523 to 539.

- recipients of property and transfer incomes.
- In contrast to the 1968 edition, the 1993 SNA recognises that the distinction between the formal and informal activities of the economy is particularly important for many developing countries.

7.3 Revisions of the scope of transactions and the production boundary

- In the 1993 SNA the following activities are listed as falling within the definition of production:
  - The production of *goods* or *services* that are supplied to units other than their producers, including the production of goods or services utilised in the production of such goods or services;
  - the own-account production of all *goods* that are retained by their producers for own final consumption or gross capital formation; and
  - the own-account production of housing *services* by owner-occupiers and of domestic and personal services produced by employing paid domestic staff.

The own-account production of domestic and personal *services* by members of the household for their own final consumption is excluded from production. The 1993 SNA does, however, suggest the compilation of satellite accounts for an alternative concept of gross domestic product to include estimates of services produced by households for their own use.

Other specifications comprise the following:
- Illegal activities should not be excluded as a matter of principle from the production boundary of the System.
- The imputed service charge for financial intermediation or financial intermediation services indirectly measured (FISIM) is to be allocated by sector and by industry.
- Government licences and fees are to be treated as taxes or expenditure for services in accordance with the conventions applied by the International Monetary Fund in the *Manual on Government Finance Statistics (GFS)*. This implies that payments by households for licences to own or use vehicles or for hunting, shooting or fishing are treated as taxes, but payments for other kinds of licences such as driving or television licences or fees paid to government – i.e. payment for passports and airport fees – are treated as purchases of services and therefore included in household consumption expenditure.
- The treatment of insurance now requires that the production value of insurance companies should be increased by taking into account the investment income of insurance companies and changes in their technical reserves. This investment income is recorded as payable to policy holders and returned by them to insurance enterprises as premium supplements (or part of the higher service charge).
- A distinction is made between *basic, producers'* and *purchasers'* prices in the valuation of outputs and inputs.
  - The *basic* price is defined as the amount receivable by the producer from the purchaser for a unit of a good or service produced as output, less any tax payable, and plus any subsidy receivable. At basic prices, any tax on the product actually payable on the output is treated as if it were paid by the purchaser directly to the government instead of being an integral part of the price paid to the producer. Any subsidy on the product is treated as if it were received directly by the purchaser and not the producer.
  - The *producer's* price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output, less any value added tax (VAT) or similar deductible tax, invoiced to the purchaser.
  - The *purchaser's* price is the amount paid by the purchaser, excluding any deductible VAT, in order to take delivery of a unit of a good or service at the time and place required by the purchaser. The purchaser's price includes any transport charges paid separately by the purchaser.
- The 1993 SNA also draws a clear distinction between financial leasing and operating leasing. The latter is defined as the activity of renting out machinery and equipment for periods shorter than the expected service lives of the capital equipment. This is a form of production in which the owner, or lessor, provides a service to the user, or lessee, and the output is valued by the rental which the lessee pays to the lessor. By contrast, financial leasing is not a process of production in itself, but a method of financing the acquisition of fixed assets.
- The treatment of gold has been explicitly clarified in the 1993 SNA. In the 1968 SNA gold was classified in two categories, namely (a) gold held as a financial asset, including gold owned by the monetary authorities which was not separately identified; and (b) other gold used for industrial purposes. The 1993 SNA distinguishes three types of gold: (a) monetary gold owned by the monetary authorities as a component of international reserves; (b) gold held as a store of value; and (c) other gold used for industrial purposes. The latter two types of gold may be owned by any kind of institutional unit or sector.

Monetary gold will normally consist of the gold held by the central bank and the central government. This implies that gold may be held as a financial asset only by monetary authorities. Therefore, purchases (sales) of monetary gold are recorded in the financial account of the domestic monetary authority as increases (decreases) in assets, and the counterparts are recorded as decreases (increases) in assets of the rest of the world.

Gold transactions by other sectors (including non-reserve gold held by the authorities and all gold held by financial institutions other than the central bank) are recorded in the capital account as a positive entry under acquisitions less disposals of valuables or change in inventories, and the counterpart entries are recorded in the accounts of the institutional units supplying the gold to the rest of the world. Monetary gold normally takes the form of coins, ingots or bars with a very high purity level and is mostly traded in organised markets or through bilateral arrangements between central banks. Consequently, the valuation of transactions is usually not a problem. When non-monetary gold is acquired from abroad, the entry is recorded under imports.

According to the 1993 SNA any increase or decrease in monetary gold holdings that results from the conversion of commodity gold to monetary gold or *vice versa* (monetisation or demonetisation) is treated as a reclassification of gold. This implies that in accordance with the *Balance of Payments Manual* where only transactions are reflected in the balance of payments accounts, the reclassification of gold does not give rise to entries in the financial accounts of the new SNA. However, the change in balance sheet positions is accounted for by entries in the other changes in the volume of assets account as a reclassification. Therefore, in the new SNA the monetisation or demonetisation of gold is purely a classification issue; there is no transaction involved.

Nominal holding gains or losses accruing during an accounting period to the owners of financial and non-financial assets and liabilities are recorded in the revaluation account. Holding gains are sometimes referred to as "capital gains". However, the term "holding gains" is widely used and preferred because it emphasises the fact that holding gains accrues purely as a result of holding assets over time without transforming them in any way. A positive holding gain, whether due to an increase in the value of a particular asset or a reduction in the value of a certain liability, increases the net worth of a unit. Holding gains include not only gains on "capital" such as fixed assets, land and financial assets, but also gains on inventories of all kinds of goods held by producers.

The nominal holding gain on a specific asset is defined as the value of the benefit accruing to the owner of that asset owing to a change in its price or, more generally, its monetary value over time. Holding gains/losses are decomposed further into neutral holding gains and real holding gains. A neutral holding gain is defined as the value of the holding gain that would accrue if the price of the asset changed in the same proportion as the general price level. By contrast, real holding gains reflect the value of the additional command over real resources accruing to the holding of an asset, as a result of a change in its price relative to general prices of goods and services in the economy.

7.4 Alternative concepts of consumption and disposable income

- A distinction is made between *individual* consumption (benefiting identifiable households) and *collective* consumption (benefiting society as a whole).
- A corresponding distinction is made between *final* consumption expenditure and *actual* final consumption. Household actual final consumption is equal to the sum of household final consumption expenditure plus individual consumption expenditure by government and NPISHs. Government actual final consumption consists only of collective consumption but NPISHs, by convention, have no actual consumption.
- The difference between *final* consumption expenditure and *actual* final consumption of households is treated as *social transfers* in kind. For households these transfers are added to disposable income to derive the concept of *adjusted disposable income;* for government and NPISHs, they are deducted.
- The 1993 SNA treats pension and other social insurance contributions and benefits in the secondary distribution of income accounts as current transfers which affect the level of disposable income of households. However, so as not to affect the value of household saving, an adjustment item is necessary to neutralise any excess of pension contributions (including investment income treated as supplementary payments) over pension receipts.

7.5 Revisions of capital formation and consumption of fixed capital

- The 1993 SNA defines gross capital formation as the total value of gross fixed capital formation, changes in inventories and the acquisitions less disposals of valuables. The latter is a new addition to the definition of gross capital formation. Valuables consist of precious stones and metals held by any unit, including enterprises, provided that they are not intended for use as intermediate input in production processes. Paintings, sculptures, recognised works of art and antiques, and other valuables such as jewellery fashioned out of precious stones and metals also count as valuables. These acquisitions less disposals of valuables were treated in various ways in the 1968 SNA. In the case of households, for instance, they were dealt with as final consumption expenditure.
- Research and development are not treated as fixed capital and the position of the 1968 SNA will remain, i.e. all research and development and training expenditure is treated as intermediate expenditure.
- Expenditure on mineral exploration, whether successful or not, is needed to acquire new reserves and is therefore treated as gross fixed capital formation.
- All expenditure by the military on fixed assets of a kind that could be acquired by civilian users for purposes

of production and used by military establishments in the same way, should be treated as fixed capital formation. This would include hospitals, schools, roads, bridges, airfields, docks and other buildings or structures. By contrast, military weapons of destruction and the equipment to deliver them, such as rockets and missiles, warships, submarines, fighter aircraft and bombers, should still be treated as intermediate expenditures. The 1968 SNA excluded from gross fixed capital formation almost all military expenditure, except the construction or alteration of family dwellings for personnel of the armed forces.

- Major expenditure on computer software is to be treated as gross fixed capital formation. All computer software that a producer expects to use in production for more than one year should be treated as an intangible fixed asset, whether it is purchased separately or with the hardware or developed in-house. It also includes databases which the enterprise expects to use for more than one year. The 1968 SNA treated as intermediate consumption all software purchased or developed independently and not bought as an integral part of major hardware.
- Literary or artistic works produced for sale are treated by the 1993 SNA as part of output. It therefore recommends that original creations such as films, the writing of books, music compositions and other literature and art works be treated as capital formation.
- Where appropriate, depreciation allowances should be calculated for infrastructural works such as roads and other assets previously treated as having infinite service lives. Although certain structures such as roads, dams, bridges and railway lines may appear to have infinite lives if properly maintained, it is also true that the value of assets may decline not only because they deteriorate physically, but also because of a decrease in the demand for their services as a result of technical progress and the availability of new substitutes.
- In principle, the construction of and major improvements to historical monuments should be recorded as fixed investment. Such monuments are usually accessible to the general public and visitors are often charged for admission to them or their vicinity.
- Human capital has not been introduced in the 1993 SNA.
- The 1993 SNA recommends that inventories held by government be extended to all inventories held, not just strategic materials.
- Assets with a long production period are treated as changes in inventories (work-in-progress) until such time as the owner is deemed to have taken ownership.

7.6 Changes in terminology

The 1993 System also suggests a number of changes to the terminology to rationalise the use of basic concepts and improve international compatibility.

- A fundamental distinction is drawn between market output, output produced for own final use and other non-market output. The distinction between market output, output produced for own final use and other non-market output has simplified the principles of valuation in the sense that the value of products of market producers is derived from the prices at which they are sold in the market. Output produced for own final use is valued according to prices of similar products on the market, while other non-market output is valued as the sum of the costs involved.
- Changes in stocks will be referred to as changes in inventories. The word "stock" will mainly be reserved for use in connection with capital stock.
- The concept gross national product is changed to gross national income.
- The distinction between direct and indirect taxes is changed and the 1993 SNA replaces the term *indirect taxes* with the term *taxes on production and imports,* while *commodity taxes* and other *indirect taxes* are replaced by the expressions *taxes on products* and *other taxes on production.*
- The 1993 SNA has also replaced the 1968 SNA term *direct taxes* with the term *current taxes on income and wealth.* Taxes on income refer to taxes payable on incomes, profits and capital gains. In addition, there are other current taxes on capital and miscellaneous activities. Current taxes on capital consist of taxes that are payable periodically – normally annually, on the property or net wealth of institutional units. Furthermore, miscellaneous current taxes refer, *inter alia*, to poll taxes and payments by households to obtain certain licences.
- In the 1993 SNA there is no reference to factor incomes.
- Corporate enterprises and quasi-corporate enterprises are referred to as *corporations* and *quasi-corporations.*
- The term *bank* is replaced by the term *financial intermediaries* and *banking services* by *financial intermediation services.*

8. Concluding remarks

The data contained in the accompanying statistical tables are the official estimates of South Africa's national accounts. Along with the input-output tables, the supply and use tables and the national financial accounts, they present a reliable and comprehensive statistical overview of the South African economy and of its evolution over time.

The compilation of South Africa's national accounts involves a continuous examining of official data sources, the development of new information sources, the utilisation of developments in the field of electronic data

processing, the incorporation of the results of econometric and theoretical studies, and continuous adherence to the specifications and definitions laid down in authoritative publications and manuals. In this regard, the 1993 SNA represents a significant achievement in providing the basis for improved macro-economic analysis. It is designed to be a flexible tool for the compilation and use of national accounts. Furthermore, it defines clearly the main economic activities and sectors and provides a clear set of accounts to measure transactions, assets and liabilities.

The revised accounting structure includes production accounts and value added at basic prices for all institutional sectors, while revisions on sectoral classifications provide for non-profit institutions serving households to be a full sector of the System. The new measure of actual final consumption will aid the international comparability of household consumption. The 1993 SNA further recommends that financial intermediation services be allocated to all users of such services and that those military structures and equipment of the same type as used by civil establishments be treated as gross fixed investment. The new System, like previous editions, does not measure the services produced within households as output, and no extensions have been proposed to deal directly with environmental costs. The asset boundary has been adjusted, but not to the extent where research and development, human capital or consumer durables are included as assets in the SNA sense.

Although the 1993 SNA does not resolve all issues or meet all the specific requirements of policy makers, it recognises the need for alternative approaches and measures that can be dealt with through the development of satellite accounts, in parallel with the national accounts. This, together with the implementation of the new recommendations, provides new opportunities for national accountants and researchers to work in an interesting, challenging and rewarding environment.

1. Insluitende nie-winssoekende instellings wat dienste aan huishoudings lewer.
2. Lopende besteding aan salarisse en lone en aan goedere en ander dienste van 'n nie-kapitale aard deur die dienste afdelings (nie sakeondernemings nie), van die algemene owerheid. Algemene owerheid sluit in sentrale regering, provinsiale regerings, plaaslike owerhede en buitebegrotingsinstellings.
3. Ná aansuiwering vir voorraadwaardering.

1. Including non-profit institutions serving households.
2. Current expenditure on salaries and wages and on goods and other services of a non-capital nature of the service departments (not business enterprises) of general government. General government includes central government, provincial governments, local authorities and extra-budgetary institutions.
3. After inventory valuation adjustment.

1. Inkome uit eiendom van algemene owerheid bestaan uit rente-, dividend- en huurontvangste van die algemene owerheid en die surplusse/tekorte van owerheidsakeondernemings.
2. Ná vastekapitaalverbruik en ná aansuiwering vir voorraadwaardering.
3. Lopende besteding aan salarisse en lone en aan goedere en ander dienste van 'n nie-kapitale aard deur die dienste afdelings (nie sakeondernemings nie) van die algemene owerheid. Algemene owerheid sluit in sentrale regering, provinsiale regerings, plaaslike owerhede en buitebegrotingsinstellings.

1. Income from property by general government consists of interest, dividend and rent receipts by general government and the surpluses/defecits of public business enterprises.
2. After consumption of fixed capital and after inventory valuation adjustment.
3. Current expenditure on salaries and wages and on goods and other services of a non-capital nature of the service departments (not business enterprises) of general government. General government includes central government, provincial governments, local authorities and extra-budgetary institutions.

1. Inkome uit eiendom van algemene owerheid bestaan uit rente-, dividend- en huurontvangste van die algemene owerheid en die surplusse/tekorte van owerheidsakeondernemings.
2. Ná vastekapitaalverbruik en ná aansuiwering vir voorraadwaardering.
3. Lopende besteding aan salarisse en lone en aan goedere en ander dienste van 'n nie-kapitale aard deur die dienste afdelings (nie sakeondernemings nie) van die algemene owerheid. Algemene owerheid sluit in sentrale regering, provinsiale regerings, plaaslike owerhede en buitebegrotingsinstellings.

1. Income from property by general government consists of interest, dividend and rent receipts by general government and the surpluses/defecits of public business enterprises.
2. After consumption of fixed capital and after inventory valuation adjustment.
3. Current expenditure on salaries and wages and on goods and other services of a non-capital nature of the service departments (not business enterprises) of general government. General government includes central government, provincial governments, local authorities and extra-budgetary institutions.

1. Inkome uit eiendom van algemene owerheid bestaan uit rente-, dividend- en huurontvangste van die algemene owerheid en die surplusse/tekorte van owerheidsakeondernemings.
2. Ná vastekapitaalverbruik en ná aansuiwering vir voorraadwaardering.
3. Lopende besteding aan salarisse en lone en aan goedere en ander dienste van 'n nie-kapitale aard deur die dienste afdelings (nie sakeondernemings nie) van die algemene owerheid. Algemene owerheid sluit in sentrale regering, provinsiale regerings, plaaslike owerhede en buitebegrotingsinstellings.

1. Income from property by general government consists of interest, dividend and rent receipts by general government and the surpluses/defecits of public business enterprises.
2. After consumption of fixed capital and after inventory valuation adjustment.
3. Current expenditure on salaries and wages and on goods and other services of a non-capital nature of the service departments (not business enterprises) of general government. General government includes central government, provincial governments, local authorities and extra-budgetary institutions.

1. Die gegewens in hierdie tabel het betrekking op private huishoudings (insluitende pensioen- en voorsorgfondse en langtermynversekeringsfondse), nie-geïnkorporeerde sakeondernemings en private nie-winssoekende instellings (bv. kerke, welsynsorganisasies en sportklubs) wat sosiale en gemeenskapsdienste aan huishoudings lewer.
2. Ná aansuiwering vir netto vergoeding aan nie-inwoners betaal.
3. Inkome uit eiendom bestaan uit dividendontvangste; rente-ontvangste verminder met rentebetalings; huurontvangste verminder met instandhoudingskoste, verbandrente en vastekapitaalverbruik; en die winste, verminder met verliese, van nie-geïnkorporeerde sakeondernemings ná verbruik van vaste kapitaal en ná aansuiwering vir voorraadwaardering.
4. Ná vastekapitaalverbruik en ná aansuiwering vir voorraadwaardering.
5. Byvoorbeeld gesondheid en onderwys.

1. The data in this table refer to private households (including pension and provident funds and long-term insurance funds), non incorporated business enterprises and private non-profit institutions (e.g. churches, welfare organisations and sport clubs) that render social and community services to households.
2. After adjustment for net remuneration paid to non-residents.
3. Income from property consists of dividend receipts; interest receipts less interest payments; rent receipts less maintenance cost, mortgage interest and consumption of fixed capital; and the profits of non-corporate business enterprises after consumption of fixed capital and after inventory valuation adjustment.
4. After consumption of fixed capital and after inventory valuation adjustment.
5. For example health and education.

1. Die gegewens in hierdie tabel het betrekking op private huishoudings (insluitende pensioen- en voorsorgfondse en langtermynversekeringsfondse), nie-geïnkorporeerde sakeondernemings en private nie-winssoekende instellings (bv. kerke, welsynsorganisasies en sportklubs) wat sosiale en gemeenskapsdienste aan huishoudings lewer.
2. Ná aansuiwering vir netto vergoeding aan nie-inwoners betaal.
3. Inkome uit eiendom bestaan uit dividendontvangste; rente-ontvangste verminder met rentebetalings; huurontvangste verminder met instandhoudingskoste, verbandrente en vastekapitaalverbruik; en die winste, verminder met verliese, van nie-geïnkorporeerde sakeondernemings ná verbruik van vaste kapitaal en ná aansuiwering vir voorraadwaardering.
4. Ná vastekapitaalverbruik en ná aansuiwering vir voorraadwaardering.
5. Byvoorbeeld gesondheid en onderwys.

1. The data in this table refer to private households (including pension and provident funds and long-term insurance funds), non incorporated business enterprises and private non-profit institutions (e.g. churches, welfare organisations and sport clubs) that render social and community services to households.
2. After adjustment for net remuneration paid to non-residents.
3. Income from property consists of dividend receipts; interest receipts less interest payments; rent receipts less maintenance cost, mortgage interest and consumption of fixed capital; and the profits of non-corporate business enterprises after consumption of fixed capital and after inventory valuation adjustment.
4. After consumption of fixed capital and after inventory valuation adjustment.
5. For example health and education.

1. Die gegewens in hierdie tabel het betrekking op private huishoudings (insluitende pensioen- en voorsorgfondse en langtermynversekeringsfondse), nie-geïnkorporeerde sakeondernemings en private nie-winssoekende instellings (bv. kerke, welsynsorganisasies en sportklubs) wat sosiale en gemeenskapsdienste aan huishoudings lewer.
2. Ná aansuiwering vir netto vergoeding aan nie-inwoners betaal.
3. Inkome uit eiendom bestaan uit dividendontvangste; rente-ontvangste verminder met rentebetalings; huurontvangste verminder met instandhoudingskoste, verbandrente en vastekapitaalverbruik; en die winste, verminder met verliese, van nie-geïnkorporeerde sakeondernemings ná verbruik van vaste kapitaal en ná aansuiwering vir voorraadwaardering.
4. Ná vastekapitaalverbruik en ná aansuiwering vir voorraadwaardering.
5. Byvoorbeeld gesondheid en onderwys.

1. The data in this table refer to private households (including pension and provident funds and long-term insurance funds), non incorporated business enterprises and private non-profit institutions (e.g. churches, welfare organisations and sport clubs) that render social and community services to households.
2. After adjustment for net remuneration paid to non-residents.
3. Income from property consists of dividend receipts; interest receipts less interest payments; rent receipts less maintenance cost, mortgage interest and consumption of fixed capital; and the profits of non-corporate business enterprises after consumption of fixed capital and after inventory valuation adjustment.
4. After consumption of fixed capital and after inventory valuation adjustment.
5. For example health and education.

1. Die gegewens in hierdie tabel het betrekking op private huishoudings (insluitende pensioen- en voorsorgfondse en langtermynversekeringsfondse), nie-geïnkorporeerde sakeondernemings en private nie-winssoekende instellings (bv. kerke, welsynsorganisasies en sportklubs) wat sosiale en gemeenskapsdienste aan huishoudings lewer.
2. Ná aansuiwering vir netto vergoeding aan nie-inwoners betaal.
3. Inkome uit eiendom bestaan uit dividendontvangste; rente-ontvangste verminder met rentebetalings; huurontvangste verminder met instandhoudingskoste, verbandrente en vastekapitaalverbruik; en die winste, verminder met verliese, van nie-geïnkorporeerde sakeondernemings ná verbruik van vaste kapitaal en ná aansuiwering vir voorraadwaardering.
4. Ná vastekapitaalverbruik en ná aansuiwering vir voorraadwaardering.
5. Byvoorbeeld gesondheid en onderwys.

1. The data in this table refer to private households (including pension and provident funds and long-term insurance funds), non incorporated business enterprises and private non-profit institutions (e.g. churches, welfare organisations and sport clubs) that render social and community services to households.
2. After adjustment for net remuneration paid to non-residents.
3. Income from property consists of dividend receipts; interest receipts less interest payments; rent receipts less maintenance cost, mortgage interest and consumption of fixed capital; and the profits of non-corporate business enterprises after consumption of fixed capital and after inventory valuation adjustment.
4. After consumption of fixed capital and after inventory valuation adjustment.
5. For example health and education.

1. Die gegewens in hierdie tabel het betrekking op private huishoudings (insluitende pensioen- en voorsorgfondse en langtermynversekeringsfondse), nie-geïnkorporeerde sakeondernemings en private nie-winssoekende instellings (bv. kerke, welsynsorganisasies en sportklubs) wat sosiale en gemeenskapsdienste aan huishoudings lewer.
2. Ná aansuiwering vir netto vergoeding aan nie-inwoners betaal.
3. Inkome uit eiendom bestaan uit dividendontvangste; rente-ontvangste verminder met rentebetalings; huurontvangste verminder met instandhoudingskoste, verbandrente en vastekapitaalverbruik; en die winste, verminder met verliese, van nie-geïnkorporeerde sakeondernemings ná verbruik van vaste kapitaal en ná aansuiwering vir voorraadwaardering.
4. Ná vastekapitaalverbruik en ná aansuiwering vir voorraadwaardering.
5. Byvoorbeeld gesondheid en onderwys.

1. The data in this table refer to private households (including pension and provident funds and long-term insurance funds), non incorporated business enterprises and private non-profit institutions (e.g. churches, welfare organisations and sport clubs) that render social and community services to households.
2. After adjustment for net remuneration paid to non-residents.
3. Income from property consists of dividend receipts; interest receipts less interest payments; rent receipts less maintenance cost, mortgage interest and consumption of fixed capital; and the profits of non-corporate business enterprises after consumption of fixed capital and after inventory valuation adjustment.
4. After consumption of fixed capital and after inventory valuation adjustment.
5. For example health and education.

1. Die gegewens in hierdie tabel het betrekking op private huishoudings (insluitende pensioen- en voorsorgfondse en langtermynversekeringsfondse), nie-geïnkorporeerde sakeondernemings en private nie-winssoekende instellings (bv. kerke, welsynsorganisasies en sportklubs) wat sosiale en gemeenskapsdienste aan huishoudings lewer.
2. Ná aansuiwering vir netto vergoeding aan nie-inwoners betaal.
3. Inkome uit eiendom bestaan uit dividendontvangste; rente-ontvangste verminder met rentebetalings; huurontvangste verminder met instandhoudingskoste, verbandrente en vastekapitaalverbruik; en die winste, verminder met verliese, van nie-geïnkorporeerde sakeondernemings ná verbruik van vaste kapitaal en ná aansuiwering vir voorraadwaardering.
4. Ná vastekapitaalverbruik en ná aansuiwering vir voorraadwaardering.
5. Byvoorbeeld gesondheid en onderwys.

1. The data in this table refer to private households (including pension and provident funds and long-term insurance funds), non incorporated business enterprises and private non-profit institutions (e.g. churches, welfare organisations and sport clubs) that render social and community services to households.
2. After adjustment for net remuneration paid to non-residents.
3. Income from property consists of dividend receipts; interest receipts less interest payments; rent receipts less maintenance cost, mortgage interest and consumption of fixed capital; and the profits of non-corporate business enterprises after consumption of fixed capital and after inventory valuation adjustment.
4. After consumption of fixed capital and after inventory valuation adjustment.
5. For example health and education.

1. Die gegewens in hierdie tabel het betrekking op private huishoudings (insluitende pensioen- en voorsorgfondse en langtermynversekeringsfondse), nie-geïnkorporeerde sakeondernemings en private nie-winssoekende instellings (bv. kerke, welsynsorganisasies en sportklubs) wat sosiale en gemeenskapsdienste aan huishoudings lewer.
2. Ná aansuiwering vir netto vergoeding aan nie-inwoners betaal.
3. Inkome uit eiendom bestaan uit dividendontvangste; rente-ontvangste verminder met rentebetalings; huurontvangste verminder met instandhoudingskoste, verbandrente en vastekapitaalverbruik; en die winste, verminder met verliese, van nie-geïnkorporeerde sakeondernemings ná verbruik van vaste kapitaal en ná aansuiwering vir voorraadwaardering.
4. Ná vastekapitaalverbruik en ná aansuiwering vir voorraadwaardering.
5. Byvoorbeeld gesondheid en onderwys.

1. The data in this table refer to private households (including pension and provident funds and long-term insurance funds), non incorporated business enterprises and private non-profit institutions (e.g. churches, welfare organisations and sport clubs) that render social and community services to households.
2. After adjustment for net remuneration paid to non-residents.
3. Income from property consists of dividend receipts; interest receipts less interest payments; rent receipts less maintenance cost, mortgage interest and consumption of fixed capital; and the profits of non-corporate business enterprises after consumption of fixed capital and after inventory valuation adjustment.
4. After consumption of fixed capital and after inventory valuation adjustment.
5. For example health and education.
