A statistical presentation of South Africa's
national accounts for the period 1946 to 1980

'n Statistiese aanbieding van Suid-Afrika se
nasionale rekeninge vir die tydperk 1946 tot 1980

Supplement to Quarterly Bulletin, September 1981
Bylaag tot Kwartaalblad, September 1981

A statistical presentation of South Africa's national accounts for the period 1946 to 1980

Introduction

Annual national accounts statistics for South Africa have been published in the **Quarterly Bulletin** of the South African Reserve Bank since 1951. Initially only estimates at current prices on an annual basis were made. For certain analytical purposes, such as determining the economic growth rate for a specific period, constant-price data are required. Consequently, current-price estimates, which reflect both quantity and price changes, have to be adjusted for price changes in order to arrive at constant-price data. Constant-price estimates of the main aggregates have been incorporated in the published national accounts since 1966. Although annual national accounts statistics are very useful in the formulation of broad economic policy and in research relating to economic growth and structural changes in the economy, and also form the basis of medium-term economic projections, they are, however, of limited use in the formulation of short-term monetary and fiscal policy. For this purpose, quarterly or even monthly national accounts statistics are required. Quarterly statistics are also useful in analysing the expenditure items sustaining economic activity and in determining the underlying strength or weakness of the economic situation at any particular moment of time. Quarterly data also form the basis of short-term econometric forecasts.

To provide in these needs, the Reserve Bank in 1960 started to collect data for the compilation of quarterly national accounts. Because some basic information required for making quarterly estimates was initially incomplete and subject to substantial margins of error, quarterly national accounts figures were at the time judged to be not reliable enough for publication. With the improvement and broadening of the basic statistics, the Reserve Bank started to publish certain quarterly national accounts data at current prices in the early nineteen-seventies. Because of the general escalation of prices since 1970, constant-price estimates were also extended to include quarterly figures. Although these quarterly constant-price estimates were used extensively in determining broad tendencies, they were published for the first time only in 1978.

National accounting figures are subject to regular revisions. This phenomenon does not apply to South African statistics only, but to the data of all countries. Frequent revisions are necessary because census results, which serve as a bench-mark basis for calculating final annual figures, normally become available only some time after the actual date of the census and usually necessitate the revision of preliminary estimates based on sample surveys. Such revisions are incorporated regularly in the published data, which are then of course no longer comparable with pre-

viously released figures. Published series in the Reserve Bank's **Quarterly Bulletin**, for example, cover only a relatively short period. In order to incorporate necessary revisions and to preserve comparability over time, two special **Supplements** were published in the course of the nineteen-seventies. In the **Supplement** to the June 1971 **Quarterly Bulletin**, comparable annual data at both current and constant prices were published for the years 1946 to 1970, but only selected quarterly figures for the period 1960 to 1970. The **Supplement** to the March 1976 **Quarterly Bulletin** was devoted entirely to quarterly statistics at current prices, and contained quarterly estimates of all the published annual national accounts aggregates for the period 1960 to 1974. In addition to these **Supplements**, comparable quarterly constant-price estimates of expenditure on the gross domestic product and particulars of private consumption expenditure and gross domestic fixed investment for the period 1970 to the third quarter of 1978 were published for the first time in the December 1978 issue of the **Quarterly Bulletin**.

Several revisions were recently made to the annual and quarterly series currently appearing in the **Quarterly Bulletin**, with the result that these statistics are no longer comparable with data published previously in the **Bulletin**. Apart from these revisions, a number of new tables were added and some existing tables expanded to broaden the statistical coverage of the national accounts. In addition, the base year for reporting constant-price series was changed in 1980 from 1970 to 1975 in line with the international change-over to the new 1975 base year. The main purpose of this **Supplement** is therefore to incorporate all these developments in one publication, containing comparable annual national accounts data for the whole of the post-war period and quarterly estimates for the period 1960 to 1980 of those selected aggregates currently appearing in the **Quarterly Bulletin**. Comparable series of data are therefore made available for research in the field of both long-term and short-term economic change in South Africa.

Concepts, definitions and classifications of main aggregates

The national accounts of South Africa¹⁾ are compiled according to international guidelines and recommendations, embodied in a special manual on national

1) South Africa is defined as the Rand Monetary Area, excluding Lesotho and Swaziland, i.e. the Republic of South Africa, South West Africa, and the independent and self-governing national Black States within the former boundaries of South Africa.

accounts published by the United Nations under the title **A System of National Accounts**.²⁾ The concepts, definitions and classifications underlying the estimates to a large extent remained almost unchanged up to 1968 when the present SNA manual was published. These changes were discussed in detail in the **Supplement to the Quarterly Bulletin** of June 1971 and are not repeated here.

It is virtually impossible to give a complete description in this **Supplement** of all the concepts, definitions and methods of calculation used in estimating every item in the national accounts. The following should, therefore, only be regarded as brief descriptions of the more important aggregates.

Gross domestic product

The gross domestic product is one of the most important aggregates appearing in the national accounts, because it serves as an indicator of total production in a country during a specific period of time. The gross domestic product, or value added, is calculated for each of the main kinds of economic activities, e.g. agriculture, mining, manufacturing, commerce, etc., as well as for certain sub-divisions, e.g. gold mining; wholesale, retail and motor trade; transport and financial services; etc.

Private consumption expenditure

Private consumption expenditure encompasses the final consumption expenditure of households (individuals) and private non-profit institutions serving households. Private consumption expenditure is classified, firstly, according to the major object or purpose for which goods are acquired. Secondly, goods are separated from services and a distinction is made between durable, semi-durable and non-durable goods. **Durable goods** are defined as goods which have an expected lifetime of use of longer than one year, such as motor-cars, caravans, boats, furniture, carpets, household appliances, etc. **Semi-durable goods** generally have a shorter expected lifetime than durable goods and their purchase value is substantially less than that of durable goods. Clothing and footwear, household textiles, furnishings and glassware, and motor-car tyres, tubes, parts and accessories for the operation of personal transport equipment are the more important articles included in semi-durable goods. **Non-durable goods** are goods of which the expected lifetime of use is less than one year. Food, beverages, tobacco, household fuel and power, and petroleum products for the operation of personal transport equipment are the main commodities included in this category. **Services** are self-explanatory and include important services such as rent, household services, medical

services, transport and communication services, catering and accommodation services, etc. A detailed list of goods and services, classified by object (purpose) and according to services and the durability of goods, as recommended in the SNA, was published in an Annexure to an article³⁾ on private consumption expenditure in the Bank's **Quarterly Bulletin** of December 1973.

Consumption expenditure by general government

Government consumption expenditure covers the current expenditure on salaries and wages and on goods and other services of a non-capital nature of the general departments, but not the business enterprises, of public authorities. Public authorities include central authorities, provincial administrations and local authorities of the defined area and other bodies such as social security funds, the S.A. Development Trust Fund, the Council for Scientific and Industrial Research (CSIR), etc. The bodies referred to as general government provide, but normally do not sell, those common services which cannot be conveniently and economically provided otherwise and are usually consumed on a collective basis. These organisations are responsible for the social and economic policies of the government and their services include, *inter alia*, defence, the maintenance of law and order, education, health services and social welfare.

Gross domestic fixed investment

Gross domestic fixed investment represents expenditure on new durable (except durable consumer goods) and productive assets which have a life expectancy extending beyond the year in which the expenditure takes place and which may, therefore, be expected to contribute to future production processes. Methods used in the calculation of investment by the general departments of public authorities differ in some respects from those used in the determination of the capital outlays of other sectors. All defence expenditure, except outlays on the construction of permanent family dwellings, is for instance regarded as consumption expenditure. Similarly, expenditure by general government on machinery and equipment is not regarded as fixed investment unless it represents the purchase of heavy equipment, e.g. road building equipment.

In the national accounts capital outlays are classified strictly according to the economic activity of the owners (and not the users) of the capital assets. Fixed investment in a specific economic activity includes those outlays by public authorities and public corporations which reflect that kind of economic activity, as well as the outlays by all private

2) United Nations, Department of Economic and Social Affairs, **A System of National Accounts**, Studies in Methods, Series F, No. 2, Rev. 3, New York, 1968. Hereafter referred to as the SNA.

business enterprises engaged in the economic activity concerned. For example, fixed investment in manufacturing includes outlays by the business enterprises of public authorities, such as the Government Printer and the South African Mint, by public corporations, such as Iscor and Sasol, and by all private manufacturing concerns. Apart from a classification by kind of economic activity and by institutional sector, fixed investment outlays can also be distinguished according to type of asset. Five economically significant types of assets are identified, namely residential buildings, non-residential buildings, construction works, transport equipment and machinery and other equipment. Outlays on a particular type of asset comprise the total amount invested in such assets by public authorities, public corporations and all private business enterprises. Outlays on **residential buildings**, therefore, include expenditure on private residential buildings and on housing schemes by the central government and local authorities, as well as the cost to agriculture, mining, manufacturing, etc., of providing housing for their employees. The category **non-residential buildings** covers factories, warehouses, office buildings, restaurants, garages and buildings for religious, educational, recreational and similar purposes. Capital outlays on **construction works** include, *inter alia*, the construction of and major alterations to railway lines, roads, streets, bridges, subways and tunnels, harbours, airports, pipelines, mine shafts, electricity transmission lines, telegraph lines and cables, dams and irrigation, drainage and sanitation projects. **Transport equipment** consists mainly of motor vehicles, ships, aircraft, railway rolling stock and tractors for road haulage. **Machinery and other equipment** includes power generating machinery, cranes and agricultural machinery and equipment such as harvesters, ploughs and tractors other than for road haulage.

Fixed capital stock

The stock of fixed capital is equal to the accumulated total of the depreciated values of all fixed investment. Additions to the capital stock, i.e. gross investment **less** depreciation, can be regarded as an increase in the existing production capacity of a country. The same classification system as for fixed investment is also used for the fixed capital stock.

Change in inventories

Inventories (or stocks) consist largely of materials and supplies, work-in-progress and finished products or goods in the possession of industries, as well as stockpiling of strategic goods. Changes in stocks are classified according to the kind of economic activity of the owner of the stocks.

Exports and imports of goods and services

Exports and imports of goods and services reflect transactions in these items by the residents of a country with the rest of the world. Included are

gold, other commodities, general merchandise and services. Factor services refer to the remuneration of factors of production, such as salaries and wages paid to migrant labour and interest and dividends on foreign investment.

National income

National income is equal to the sum of the factor incomes distributed to the permanent residents of a country, and consists of remuneration of employees and net entrepreneurial and property income, such as profits, rent, interests and dividends. National income represents the total income of a country in a specific period.

National disposable income

National disposable income is equivalent to national income **plus** net current transfers received from the rest of the world, and reflects the total amount available for consumption and saving.

Personal disposable income

Personal disposable income is the income of households available for consumption and saving. It is represented by current income i.e. remuneration of employees, net property and entrepreneurial income and net current transfer receipts, **less** direct taxes.

Gross domestic saving

Gross domestic saving is that portion of total income which is not consumed during a certain period of time but is available for the financing of investment. It consists of personal saving, corporate saving, the saving of general government and provision for depreciation. In more general terms, saving is the difference between current income and current expenditure.

Methods of calculation and sources of information

In this section a brief description is provided of the sources used and methods employed to obtain annual and quarterly estimates of the main national accounts aggregates at both current and constant prices.

Gross domestic product

In calculating the gross domestic product, three different methods can be applied. Firstly, total gross domestic product can be calculated according to the **expenditure** method, i.e. by adding together all the so-called expenditure items on final goods and services, such as consumption expenditure, investment and exports **less** imports. To estimate the gross domestic product by kind of economic activity, either the **production** or **income** method must be applied. According to the **production** method, the gross domestic product, or the value added, is estimated as the difference between the value of production and outlays on intermediate goods and services. The

third approach, or the **income** method, is to add together the remuneration of the different factors of production employed in the production process. Except for agriculture, where the **production** approach is applied, the **income** method is used to calculate the gross domestic product at current prices for the other kinds of economic activity. For this purpose, a distinction is made between two components, namely remuneration of employees and gross operating surplus. Remuneration of employees covers gross salaries, wages and allowances, whether in cash or in kind, including employers' contributions to holiday, pension, provident and medical funds, but before deducting employees' contributions to the above funds and income taxes under the PAYE-system. Gross operating surplus comprises gross output **less** intermediate consumption and remuneration of employees. Gross operating surplus is also equal to net profit, before providing for dividend and income tax payments, **plus** net interest payments and provision for depreciation.

The calculation of remuneration of employees is based on monthly and quarterly data of wages and salaries paid to employees in virtually all sectors of the economy, collected and published by the Department of Statistics. At present these series cover more than eighty per cent of all wages and salaries earned in the non-agricultural sectors of the economy. Wages and salaries paid by the agricultural sector are estimated by the Department of Agriculture and Fisheries.

The gross operating surplus of **agriculture and forestry** is estimated by the Department of Agriculture and Fisheries by deducting from the gross receipts the value of intermediate goods and services consumed and the remuneration paid to employees. The gross operating surplus of **mining, manufacturing and trade** is estimated on the basis of census results and quarterly surveys of financial statistics conducted by the Department of Statistics and the Reserve Bank. In the case of **construction** the gross operating surplus is obtained by means of interpolation and extrapolation of census results on the basis of fixed investment in buildings and construction works. For the sector **electricity, gas and water** the gross operating surplus is calculated from information obtained from the most important enterprises involved. In the case of **transport, storage and communication** the gross operating surplus of the South African Railways Administration is calculated from the monthly publication of its trading results, whereas that of the Department of Posts and Telecommunications is based on statistics submitted to the Reserve Bank and the Department of Statistics. Data relating to the gross operating surplus of **financial institutions** are obtained by the Reserve Bank from banking institutions, building societies and insurance companies. In the case of **real estate** the gross operating surplus is estimated on the basis of a combined index consisting of the total number of residential units and house and flat rent. Total gross domestic

product at **factor cost** is obtained by adding together the remuneration of employees and gross operating surpluses of the different sectors.

To convert the gross domestic product at factor cost to **market prices**, indirect taxes are added to and subsidies deducted from the estimates at factor cost. Information pertaining to these two items is obtained from an analysis of government accounts by the Reserve Bank. To arrive at the gross **national** product at market prices, net factor payments to the rest of the world are deducted from the estimates of gross **domestic** product. These payments are obtained from balance of payments data compiled by the Reserve Bank.

Constant-price estimates of the gross domestic product are made for each major branch of industry. Annual totals are computed as the sum of quarterly estimates. In the case of **agriculture and forestry** the double deflation method is used. Gross output and intermediate expenditure at current prices are separately deflated by appropriate price indices, and the value added at constant prices is computed as the difference between gross output and intermediate outlays. The real value added by the **fishing industry** is computed by extrapolating the base-year estimates by appropriate volume indices. Base-year estimates of the value added by the **mining sector** are extrapolated by means of indices of the physical volume of gold and non-gold mining production. The base-year estimates of the value added by each of the main sub-sections of **manufacturing** are extrapolated by their corresponding indices of physical volume of production. Units of electricity current generated is used as an indicator to extrapolate the value added by **electricity** in the base year. The base-year estimate of the real value added by **construction** is extrapolated by an index of real fixed investment, obtained by deflating the capital investment at current prices by appropriate price indices. In the case of **commerce**, the base-year values are extrapolated by means of deflated trade turnover figures arrived at by deflating the value of wholesale and retail sales by means of appropriate price indices. Volume indicators are used to extrapolate base-year estimates of the value added by **transport and communication**.

Base-year estimates of the real value added by **finance and insurance** are extrapolated by appropriate volume indicators, computed by deflating, by means of appropriate price indices, a representative selection of the transactions of the industry. The contribution to the real gross domestic product by owners of **real estate** in the base year is extrapolated by means of the total number of existing buildings, whereas the base-year real value added by real estate agents and developers is extrapolated by a value index of real estate transactions, deflated by a price index of construction. The real value added by **other business services** is obtained by either deflating the current price estimates by appropriate price indices or by extrapolating the base-year estimates by the number of persons employed by the relevant

business services. In the case of **community, social and personal services** the number of persons employed is either used as an indicator to extrapolate base-year values, or the value added at current prices is deflated by appropriate price indices. Because no appropriate official indices of salary and wage scales exist, the base-year value added by **producers of government services** is extrapolated by the number of persons employed by general government.

Private consumption expenditure

A large number of sources are used to estimate private consumption expenditure. Expenditure on food is estimated by the Department of Agriculture and Fisheries whose calculations, in turn, are based on data concerning the marketing of the most important agricultural products. Consumer outlays on beverages and tobacco are estimated by means of excise figures. Estimates of expenditure on clothing, footwear, furniture, furnishings, medicine, recreational and entertainment goods, etc., are based on retail sales data collected by the Department of Statistics. The value of new transport equipment purchased is obtained by multiplying the number of motor vehicles and motor cycles sold by appropriate prices. Running expenses of private motor vehicles such as petrol, oil, tyres and spare parts are calculated by using trading revenue data of the motor trade and data obtained from the Automobile Association. Rent paid is based on the number of dwelling units and average rent on houses and flats. The remaining part of private consumption expenditure is estimated on the basis of miscellaneous series, such as the income of the South African Railways Administration and the Department of Posts and Telecommunications, sales of newspapers and periodicals, salaries, wages and allowances paid to domestic servants, trading results of licensed hotels, the number of doctors, dentists, etc., hospital fees accruing to provincial administrations, the number of deaths and births, etc.

To convert private consumption expenditure at current prices to constant prices, each component is revalued at base-year prices and then added together to arrive at total private consumption expenditure at constant prices. Where possible, real values are calculated by extrapolating base-year figures by appropriate volume indices. In the absence of volume indices, appropriate price indices are used to convert the relevant current-price estimates to constant-price series. If neither of the above methods can be applied successfully, the general consumer price index is used to deflate the series. The latter method is used only in respect of items comprising a very small proportion of total private consumption expenditure. Use is made of a large number of different indices, such as those available for components of the consumer and the production price indices, retail sales and the physical volume of manufacturing production, as well as of information collected directly by the Reserve Bank.

Government consumption expenditure

Consumption expenditure by the central government is estimated provisionally on issues from the Exchequer Account. It is revised subsequently on the basis of audited reports and information on actual expenditure obtained from the Department of Statistics. The relevant expenditure of provincial administrations and that of local authorities are compiled from audited reports, returns submitted directly to the Reserve Bank and from data collected by the Department of Statistics.

To estimate real flows, a distinction is made between two components, namely wages, salaries and allowances, and other current expenditure. The base-year value of wages, salaries and allowances is extrapolated by the number of persons employed by general government. Estimates of government expenditure on goods and other services at constant prices are obtained by deflating the expenditure at current prices by a weighted index compiled from the production prices of different types of goods and services.

Gross domestic fixed investment

The investment of public authorities, consisting of the central government, provincial administrations and local authorities, and that of public corporations are estimated by means of audited reports and returns submitted to the Reserve Bank and the Department of Statistics by the South African Railways Administration, the Department of Posts and Telecommunications, the largest public corporations and all the provincial administrations, and information obtained from a sample survey of the more important government departments and local authorities.

As far as the investment of the private sector is concerned, the investment of **agriculture** is estimated by the Department of Agriculture and Fisheries from the results of annual census reports and quarterly surveys. Fixed investment by **manufacturing, mining and commerce** (in the case of commerce, machinery and equipment only) are based on census results and quarterly sample surveys of capital expenditure conducted by the Department of Statistics and the Reserve Bank. Estimates of investment on **residential buildings** and the outlays on buildings by the sectors **commerce, private transport, financial institutions**, etc., are based on data regarding the value of buildings completed in the metropolitan and certain other urban areas collected by the Department of Statistics. **Transfer costs** are based on transfer duties collected by the central government and the value of real estate transactions.

To convert gross domestic fixed investment at current prices to constant prices, expenditure at current prices by type of asset for each of the nine economic sectors and three types of institutions is deflated to obtain values at base-year prices. These deflated values are then added together to arrive at total gross domestic fixed investment at constant

prices. In the case of construction works and residential and non-residential buildings, the estimates at current prices are deflated by means of price indices of material inputs and labour costs for each of the three types of assets, adjusted for measurable changes in labour productivity. In the case of transport equipment, machinery and other equipment, outlays at current prices are deflated by separate indices for these items, based on information obtained from the Department of Statistics.

Change in inventories

Changes in agricultural stocks and livestock are estimated by the Department of Agriculture and Fisheries from agricultural census reports and the results of short-term surveys. Changes in mining, industrial and commercial inventories are based on data obtained from census reports and quarterly surveys. The changes in diamond and strategic stocks are calculated from confidential information submitted to the Reserve Bank. Changes in agricultural stocks-in-trade are estimated from data obtained from agricultural control boards and co-operative societies. The change in inventories is calculated as the difference between the opening and closing value of the stocks. The principles of stock valuation used in business accounting are often different from those required for national accounting purposes. The value of stocks reflected in the books of business enterprises normally represents book values, whereas physical changes in stocks, valued at the average of purchase prices, are needed for the national accounts. The book values of industrial and commercial stocks are therefore adjusted before the actual change can be calculated. The difference between the change in the book values and the change in the adjusted values is referred to as "inventory valuation adjustment".

In the case of constant-price estimates, the changes in agricultural livestock are obtained by multiplying the changes in the number of the different kinds of livestock by an average base-year value applicable to the type of livestock concerned. In the case of industrial and commercial inventories, the opening and closing book values of the inventories are deflated by means of the average production price index over the last five and four months, respectively, and the changes in the deflated values calculated. Changes in real agricultural stocks-in-trade are obtained by valuing the physical change in the stocks of the various types of products at appropriate base-year prices. Changes in constant-price estimates of all other types of stocks are obtained by deflating the closing stock figure for a specific sector by the average production price index for the relative period, and by calculating the period to period changes in the deflated stock figures.

Exports and imports of goods and services

Estimates at current prices are based on balance of payments data, compiled by the Reserve Bank.

Constant-price estimates are obtained by extrapolating base-year values by means of appropriate volume indicators or by deflating the values at current prices by appropriate price indices. Thus, the net value of gold exports at constant prices is obtained by extrapolating the value in 1975 on the basis of the number of kilograms of fine gold produced, adjusted for balance of payments purposes. The value of merchandise exports at constant prices is calculated by deflating the value at current prices by means of a price index compiled from the index of the average unit values of merchandise exports. The value of service exports at constant prices is obtained by deflating the components of such services at current prices by appropriate indices, such as freight and insurance tariffs, passenger fares and consumer prices of tourist expenditure in the domestic economy.

The value of merchandise imports at constant prices is calculated by deflating the value at current prices by means of a price index of the average unit values of merchandise imports. The value of imports of services at constant prices is obtained by deflating the components of such services at current prices by a weighted price index of items such as freight tariffs, passenger fares and consumer prices of selected foreign countries.

Real fixed capital stock

The so-called "perpetual inventory method" is used for the calculation of the real fixed capital stock of South Africa. The method involves the accumulation of real net fixed investment figures, i.e. gross fixed investment at constant prices minus provision for depreciation at constant prices. The method for converting gross domestic fixed investment at current prices to constant prices was discussed above.

In the calculation of provision for depreciation or capital consumption, certain assumptions about the average economic lifetimes of the various assets are made. The assumed lifetimes vary from 80 years in the case of construction works in the agricultural sector to 8 years for transport equipment. No provision for depreciation is made for construction works of general government departments. In the latter case, it is argued that the economic lifetime of these construction works could be prolonged indefinitely by adequate maintenance and reparation.

Based on these assumptions, the annual provision for depreciation at constant prices is calculated by adopting the conventional "straight line method". According to this method, the original cost of an asset is written off in equal amounts over the economic lifetime of the asset. Real capital stock for, say, 1946 was obtained by accumulating the annual real gross fixed investment figures for a period equal to the economic lifetime of the particular type of asset and by deducting from this total the accumulated provision for depreciation in respect of these outlays over the same period. For subsequent years the capital stock is obtained by adding the annual net

fixed investment figures to the capital stock of the preceding year.

Current income and expenditure of incorporated business enterprises

The main items calculated are net operating surplus, income from property such as interest and dividends, and direct taxes. Corporate saving represents the difference between current income and current expenditure. A detailed account is computed for each of the different kinds of economic activities and then added together. The main sources of information are the results of census surveys conducted by the Department of Statistics, quarterly sample surveys undertaken by the Department of Statistics and the Reserve Bank and financial data extracted from company reports.

Seasonal adjustment of national accounts data

Most national accounts series show a distinct seasonal pattern, arising from such factors as climatic conditions, which influence the production and marketing of agricultural crops; public holidays and festive seasons such as Christmas and the Easter week-end, which affect personal expenditure; tax collections on specific dates of the year, which have an influence on government revenue and saving; payments of company dividends and taxes which influence corporate saving; etc. In these cases the basic underlying tendencies in the data are obscured to some extent by the regular seasonal pattern. For this reason, it is desirable to eliminate the influence of seasonal movements from the different series. Despite the problems relating to the technique followed to adjust the data for seasonal influences, the adjusted totals provide a more accurate picture of basic economic conditions than the unadjusted data. If the seasonally adjusted quarterly data are multiplied by four, an indication is obtained of the possible magnitude of the annual total, assuming that the level of economic activity of the specific quarter would continue to prevail also during the subsequent three quarters. Totals obtained in this manner are referred to as "seasonally adjusted, at annual rates."

The Reserve Bank chose the X-11 Variant of the **U.S Census Method II** from a number of available methods of adjusting economic time series for seasonal variations. This method, which is currently widely used throughout the world, was discussed in detail in the **Supplement** to the Bank's **Quarterly Bulletin** of September 1971, titled "A statistical presentation of selected economic indicators of South Africa for the period 1946 to 1970".

'n Statistiese aanbieding van Suid-Afrika se nasionale rekeninge vir die tydperk 1946 tot 1980

Inleiding

Jaarlikse nasionale rekeninge-gegewens vir Suid-Afrika word sedert 1951 in die **Kwartaalblad** van die Suid-Afrikaanse Reserwebank gepubliseer. Aanvanklik is slegs ramings teen heersende pryse op 'n jaargrondslag gemaak. Vir sekere analitiese doeleindes, soos die bepaling van die ekonomiese groeikoers vir 'n bepaalde tydperk, word gegewens teen konstante pryse benodig. Gevolglik moet die ramings teen heersende pryse, wat sowel hoeveelheds- as prysveranderings weerspieël, vir prysveranderings aangesuiwer word ten einde ramings teen konstante pryse te verkry. Ramings van die belangrikste groothede teen konstante pryse word sedert 1966 by die gepubliseerde nasionale rekeninge ingesluit. Ofskoon jaarlikse nasionale rekeninge-gegewens nuttig is by die formulering van breë ekonomiese beleid en by navorsing aangaande ekonomiese groei en struktuurveranderings in die ekonomie, en ook die basis vorm van middeltermyn ekonomiese vooruitskattings, is hulle egter van beperkte nut by die formulering van korttermyn monetêre en fiskale beleid. Vir hierdie doel word kwartaallikse of selfs maandelikse nasionale rekeninge-gegewens benodig. Kwartaallikse statistieke is ook nuttig by die ontleding van die bestedingsposte wat ekonomiese bedrywigheid onderskraag en om die onderliggende sterkte of swakheid van die ekonomiese toestand op 'n bepaalde tydstip te bepaal. Kwartaallikse gegewens vorm ook die basis van korttermyn ekonometriele vooruitskattings.

Ten einde in hierdie behoeftes te voorsien, het die Reserwebank in 1960 gegewens begin versamel vir die samestelling van kwartaallikse nasionale rekeninge. Aangesien sommige van die basiese gegewens wat benodig word om kwartaalramings te maak aanvanklik onvolledig en aan aansienlike foutegrense onderhewig was, is die kwartaallikse nasionale rekeningsyfers op daardie stadium nie as betroubaar genoeg vir publikasie beskou nie. Met die verbetering en uitbreiding van die basiese statistieke, het die Reserwebank in die vroeë sewentigerjare begin om sekere kwartaallikse nasionale rekeninge-gegewens teen heersende pryse te publiseer. As gevolg van die algemene skerp styging in pryse sedert 1970, is die ramings teen konstante pryse ook uitgebrei om kwartaalsyfers in te sluit. Ofskoon hierdie kwartaalramings teen konstante pryse in 'n ruim mate by die bepaling van breëre neigings gebruik is, is hulle eers in 1978 vir die eerste keer gepubliseer.

Nasionale rekeninge-syfers is aan gereelde hersienings onderhewig. Hierdie verskynsel is nie net op Suid-Afrikaanse statistieke van toepassing nie, maar op die gegewens van alle lande. Gereelde hersienings is nodig omdat sensusresultate, wat as 'n verwysingsbasis vir die berekening van finale jaarsyfers dien, gewoonlik eers 'n geruime tyd na die werklike datum van die sensus beskikbaar kom en gewoonlik die hersiening van voorlopige ramings wat op steekproef-

opnames gebaseer is, noodsaak. Sodanige hersienings word gereeld by die gepubliseerde gegewens ingesluit, wat dan natuurlik nie meer met die syfers wat voorheen vrygestel is vergelykbaar is nie. Die gepubliseerde reekse in die Reserwebank se **Kwartaalblad** dek byvoorbeeld net 'n betreklike kort tydperk. Ten einde die nodige hersienings te inkorporeer en om vergelykbaarheid oor tyd te behou, is twee spesiale **Bylaes** in die loop van die sewentigerjare gepubliseer. In die **Bylaag** tot die **Kwartaalblad** van Junie 1971 is vergelykbare jaarsyfers teen sowel heersende as konstante pryse vir die jare 1946 tot 1970 gepubliseer, maar slegs uitgesoekte kwartaalsyfers vir die tydperk 1960 tot 1970. Die **Bylaag** tot die **Kwartaalblad** van Maart 1976 is in sy geheel aan kwartaalstatistieke teen heersende pryse gewy, en het kwartaalramings van al die gepubliseerde jaarlikse nasionale rekeninge vir die tydperk 1960 tot 1974 bevat. Bykomstig tot hierdie **Bylaes**, is vergelykbare kwartaalramings teen konstante pryse van die besteding aan die bruto binnelandse produk en besonderhede van private verbruiksbesteding en bruto binnelandse vaste investering vir die tydperk 1970 tot die derde kwartaal van 1978 vir die eerste keer in die Desember 1978-uitgawe van die **Kwartaalblad** gepubliseer.

Verskeie hersienings is onlangs aan die jaar- en kwartaalreekse wat tans in die **Kwartaalblad** verskyn aangebring, met die gevolg dat hierdie gegewens nie meer met die statistieke wat voorheen in die **Kwartaalblad** gepubliseer is vergelykbaar is nie. Afgesien van hierdie hersienings, is 'n aantal nuwe tabelle bygevoeg en sommige van die bestaande tabelle uitgebrei om die statistiese dekking van die nasionale rekeninge te verbreed. Daarbenewens is die basisjaar vir die rapportering van reekse teen konstante pryse in 1980 van 1970 tot 1975 verander, in ooreenstemming met die internasionale omskakeling na 1975 as die nuwe basisjaar. Die vernaamste doel van hierdie **Bylaag** is derhalwe om al hierdie ontwikkelings saam te vat in een publikasie, wat vergelykbare jaarlikse nasionale rekeninge-gegewens vir die hele na-oorlogse tydperk bevat, en kwartaalramings vir die tydperk 1960 tot 1980, van daardie uitgesoekte groothede wat tans in die **Kwartaalblad** verskyn. Vergelykbare reekse van gegewens word gevolglik nou beskikbaar gestel vir navorsing op die gebied van sowel lang- as korttermyn ekonomiese veranderings in Suid-Afrika.

Begrippe, definisies en klassifikasies van die vernaamste groothede

Die nasionale rekeninge van Suid-Afrika¹⁾ word saamgestel volgens internasionale riglyne en aanbeve-

1) Suid-Afrika word gedefinieer as die Rand Monetêre Gebied, uitgesonderd Lesotho en Swaziland, dit wil sê die Republiek van Suid-Afrika, Suidwes-Afrika, en die onafhanklike en selfregerende nasionale Swart state binne die voormalige grense van Suid-Afrika.

lings soos vervat in 'n spesiale handleiding oor die nasionale rekeninge wat deur die Verenigde Volke-Organisasie onder die titel **A System of National Accounts**²⁾ gepubliseer is. Die begrippe, definisies en klassifikasies wat die ramings ten grondslag lê, het in 'n groot mate feitlik onveranderd gebly tot 1968 toe die huidige SNA-handleiding gepubliseer is. Hierdie verandering is in besonderhede in die **Bylaag** tot die **Kwartaalblad** van Junie 1971 bespreek en word nie hier herhaal nie.

Dit is feitlik onmoontlik om in hierdie **Bylaag** 'n volledige beskrywing te gee van al die begrippe, definisies en berekeningsmetodes wat vir die raming van elke item in die nasionale rekeninge gebruik word. Die volgende moet derhalwe slegs as kort beskrywings van die belangrikste groothede gesien word.

Bruto binnelandse produk

Die bruto binnelandse produk is een van die belangrikste groothede wat in die nasionale rekeninge voorkom, aangesien dit as 'n aanwyser van die totale produksie in 'n land gedurende 'n bepaalde tydperk dien. Die bruto binnelandse produk, of toegevoegde waarde, word vir elk van die hoofgroepe van ekonomiese bedrywigheid bereken, byvoorbeeld die landbou, mynbou, fabriekswese, handel, ens., asook vir sekere onderverdelings, byvoorbeeld goudmynbou; groot-, klein-, en motorhandel; vervoer- en finansiële dienste; ens.

Private verbruiksbesteding

Private verbruiksbesteding omvat die finale verbruiksbesteding van huishoudings (individue) en private nie-winssoekende instellings wat huishoudings dien. Private verbruiksbesteding word eerstens geklassifiseer volgens die oogmerk of doel waarvoor die goedere aangeskaf word. Tweedens, word goedere van dienste onderskei en 'n onderskeid word gemaak tussen duursame, semi-duursame en nie-duursame goedere. **Duursame goedere** word gedefinieer as goedere wat 'n verwagte gebruiksduur van langer as een jaar het, soos passasiersmotors, woonwaens, bote, meubels, tapyte, huishoudelike toestelle, ens. **Semi-duursame goedere** het oor die algemeen 'n korter verwagte lewensduur as duursame goedere en hulle aankoopwaarde is aansienlik minder as dié van duursame goedere. Klerasie en skoeisel, huishoudelike tekstiele, toebehore en glasware, en motorbuite- en -binnebande, -onderdele en -toebehore vir die instandhouding van persoonlike vervoertoerusting is van die belangrikste artikels wat by semi-duursame goedere ingesluit word. **Nie-duursame goedere** is goedere waarvan die verwagte gebruiksduur minder as een jaar is. Voedsel, drank en tabak, huishoudelike brandstof en krag, en petro-

leumprodukte vir gebruik in persoonlike vervoertoerusting is die belangrikste kommoditeite wat by hierdie klas ingesluit word. **Dienste** is selfverduidelikend en omvat belangrike dienste soos huur, huishoudelike dienste, mediese dienste, vervoer- en kommunikasiedienste, verversings- en akkommodasiedienste, ens. 'n Omvattende lys van goedere en dienste, geklassifiseer volgens oogmerk (doel) en volgens dienste en die duursaamheid van goedere, soos aanbeveel in die SNA, is in 'n aanhangsel tot 'n artikel³⁾ oor private verbruiksbesteding in die Bank se **Kwartaalblad** van Desember 1973 gepubliseer.

Verbruiksbesteding deur die algemene owerheid

Owerheidsverbruiksbesteding omvat die lopende besteding aan salarisse en lone en aan goedere en ander dienste van 'n nie-kapitale aard deur die algemene afdelings, maar nie die sake-ondernemings nie, van die openbare owerhede. Openbare owerhede sluit in sentrale owerhede, provinsiale administrasies en plaaslike owerhede in die gedefinieerde gebied en ander liggame soos bestaansbeveiligingsfondse, die Suid-Afrikaanse Ontwikkelingstrustfonds, die Wetenskaplike en Nywerheidsnavorsingsraad (WNNR), ens. Die liggame waarna verwys word as die algemene owerheid voorsien, maar verkoop normaalweg nie, daardie algemene dienste wat gewoonlik op 'n kollektiewe basis verbruik word en nie andersins gerieflik en ekonomies voorsien kan word nie. Hierdie organisasies is verantwoordelik vir die sosiale en ekonomiese beleid van die regering en hulle dienste sluit onder andere verdediging, die handhawing van wet en orde, onderwys, gesondheidsdienste en maatskaplike welstandsdienste in.

Bruto binnelandse vaste investering

Die bruto binnelandse vaste investering verteenwoordig die besteding aan nuwe duursame (uitgesonderd duursame verbruiks goedere) en produktiewe bates wat 'n verwagte lewensduur het van langer as die jaar waarin die besteding plaasvind en wat, derhalwe, verag kan word om tot toekomstige produksieprosesse by te dra. Die metodes wat in die berekening van die vaste investering deur die algemene afdelings van openbare owerhede gebruik word, verskil in sekere opsigte van dié wat gebruik word in die bepaling van die kapitaalbesteding van ander sektore. Alle verdedigingsuitgawes, uitgesonderd besteding aan die oprigting van permanente gesinswonings, word byvoorbeeld as verbruiksbesteding beskou. Net so word die besteding van die algemene owerheid aan masjinerie en toerusting nie as vaste investering beskou nie, tensy dit die aankoop van swaar toerusting, byvoorbeeld padbautoerusting, verteenwoordig.

In die nasionale rekeninge word kapitaalbesteding streng volgens die eienaars (en nie die gebruikers nie)

2) Verenigde Volke-Organisasie, Departement of Economic and Social Affairs, **A System of National Accounts**, Studies in Methods, Series F, No.2, Rev.3, New York, 1968. Hierna die SNA genoem.

3) van Rensburg, J.J.J., Private verbruiksbesteding in Suid-Afrika: 1947 tot 1972, **Suid-Afrikaanse Reserwebank Kwartaalblad**, No.110, Desember 1973, bladsy 65.

van die kapitaalbates geklassifiseer. Vaste investering in 'n sekere ekonomiese bedrywigheid omvat daardie besteding deur openbare owerhede en openbare korporasies wat die betrokke ekonomiese bedrywigheid verteenwoordig, sowel as die besteding deur alle private sake-ondernemings wat die betrokke ekonomiese bedrywigheid verrig. Vaste investering in die fabriekswese omvat byvoorbeeld besteding deur die sake-ondernemings van openbare owerhede, soos die Staatsdrukker en die Suid-Afrikaanse Munt, besteding deur openbare korporasies, soos Yskor en Sasol, en besteding deur alle private fabrieksondernemings. Afgesien van die klassifikasie volgens tipe ekonomiese bedrywigheid en volgens institusionele sektor, kan besteding aan vaste investering ook volgens tipe bate onderskei word. Vyf ekonomies belangrike tipes van bates word geïdentifiseer, naamlik woongeboue, nie-woongeboue, konstruksiewerke, vervoertoerusting, en masjinerie en ander toerusting. Besteding aan 'n besondere tipe bate verteenwoordig die totale bedrag wat in sodanige bates deur openbare owerhede, openbare korporasies en alle private sake-ondernemings geïnvesteer is. Besteding aan **woongeboue** sluit derhalwe in die besteding aan private woongeboue en aan behuisingskemas deur die sentrale regering en plaaslike owerhede, sowel as die koste vir die landbou, die mynbou, die fabriekswese, ens., van die voorsiening van behuising aan hulle werknemers. Die kategorie **nie-woongeboue** dek fabrieke, pakhuse, kantoorgeboue, restaurante, motorhawens en geboue vir godsdienstige, opvoedkundige, ontspannings- en soortgelyke doeleindes. Kapitaalbesteding aan **konstruksiewerke** sluit onder andere in die konstruksie van of groot veranderings aan spoorlyne, paaie, strate, brûe, deurgange en tunnels, hawens, lughawens, pyplyne, mynsgakte, elektriese kraglyne, telefoonlyne en -kabels, damme en besproeiingskemas, dreinerings en sanitasie-projekte. **Vervoertoerusting** bestaan hoofsaaklik uit motorvoertuie, skepe, vliegtuie, rollende materiaal van die Spoorweë en trekkers vir padvervoer. **Masjinerie en ander toerusting** sluit in kragopwekkers, hyskrane en landboumasjinerie en toerusting soos stropers, ploë en trekkers, uitgesonderd die vir padvervoer gebruik.

Vaste kapitaalvoorraad

Die vaste kapitaalvoorraad is gelyk aan die opgehoopde totaal van die gedepresieerde waardes van alle vaste investering. Toevoegings tot die kapitaalvoorraad, dit wil sê bruto investering **min** waardevermindering, kan gesien word as 'n toename in die bestaande produksiekapasiteit van 'n land. Dieselfde klassifikasiestelsel as vir vaste investering word ook vir die vaste kapitaalvoorraad gebruik.

Verandering in voorraad

Voorraad bestaan hoofsaaklik uit grondstowwe en gebruiksvorrade, halffabrikate en afgewerkte produkte of goedere in die besit van nywerhede, sowel as voorraadoppotting van strategiese goedere. Verande-

rings in voorraad word geklassifiseer volgens die tipe ekonomiese bedrywigheid van die besitter van die voorraad.

Uitvoer en invoer van goedere en dienste

Die uitvoer en invoer van goedere en dienste weerspieël transaksies in hierdie poste deur die inwoners van 'n land met die res van die wêreld. Goud, ander goedere, algemene handelsware en dienste word hierby ingesluit. Faktordienste verwys na die vergoeding van produksiefaktore soos salarisse en lone wat aan trekarbeiders betaal word en die rente en dividende op buitelandse beleggings.

Nasionale inkome

Nasionale inkome is gelyk aan die som van die faktorinkomes wat aan die permanente inwoners van 'n land toegedeel word, en bestaan uit die vergoeding van werknemers en netto ondernemers- en eiendomsinkome soos winste, huur, rente en dividende. Nasionale inkome verteenwoordig die totale inkome van 'n land in 'n bepaalde tydperk.

Nasionale beskikbare inkome

Nasionale beskikbare inkome is gelyk aan die nasionale inkome **plus** die netto lopende oordragte wat van die res van die wêreld ontvang word en weerspieël die totale bedrag wat vir besteding en besparing beskikbaar is.

Persoonlike beskikbare inkome

Persoonlike beskikbare inkome is die inkome van huishoudings wat vir besteding en besparing beskikbaar is. Dit word verteenwoordig deur die lopende inkome, dit wil sê die vergoeding van werknemers, netto eiendoms- en ondernemersinkome en netto lopende oordragontvangste, **min** direkte belastinge.

Bruto binnelandse besparing

Die bruto binnelandse besparing is daardie deel van die totale inkome wat nie gedurende 'n bepaalde tydperk verbruik word nie, maar beskikbaar is vir die finansiering van investering. Dit bestaan uit persoonlike besparing, maatskappybesparing, besparing van die algemene owerheid en die voorsiening vir waardevermindering. Meer algemeen gestel is besparing die verskil tussen lopende inkome en lopende uitgawe.

Metodes van berekening en bronne van inligting

In hierdie afdeling word 'n kort beskrywing gegee van die bronne en metodes wat gebruik word om jaarlikse en kwartaallikse ramings van die belangrikste groot-hede in die nasionale rekeninge teen sowel heersende as konstante pryse te maak.

Bruto binnelandse produk

By die berekening van die bruto binnelandse produk kan drie verskillende metodes gebruik word. Ten

eerste kan die totale bruto binnelandse produk bereken word volgens die **bestedingsmetode**, dit wil sê deur al die sogenaamde bestedingsposte van finale goedere en dienste bymekaar te tel, soos verbruiks-besteding, investering en die uitvoer **min** invoer. Om die bruto binnelandse produk volgens tipe ekonomiese bedrywigheid te raam, moet of die **produksie**- of die **inkomemetode** gebruik word. Volgens die **produksiemetode** word die bruto binnelandse produk, of die toegevoegde waarde, geraam as die verskil tussen die waarde van produksie en die besteding aan intermediêre goedere en dienste. Die derde benadering, of die **inkomemetode**, bestaan daaruit dat die vergoeding van die verskillende produksiefaktore wat in die produksieproses aangewend word, bymekaar getel word. Afgesien van die landbou, waar die **produksiebenadering** gevolg word, word die **inkomemetode** gebruik om die bruto binnelandse produk teen heersende pryse vir al die ander tipes van ekonomiese bedrywigheid te bereken. Vir hierdie doel, word 'n onderskeid getref tussen twee komponente, naamlik die vergoeding van werknemers en die bruto bedryfsurplus. Die vergoeding van werknemers omvat bruto salarisse, lone en toelaes, hetsy in kontant of in natura, insluitende werkgewers se bydraes tot vakansie-, pensioen-, voorsorg- en mediese fondse, maar vóór die aftrekking van werknemers se bydraes tot die genoemde fondse en inkomstebelasting volgens die lopende betaalstelsel. Die bruto bedryfsurplus bestaan uit bruto produksie **min** intermediêre verbruik en die vergoeding van werknemers. Die bruto bedryfsurplus is ook gelyk aan netto winste vóór voorsiening vir dividend- en inkomstebelastingbetalings, **plus** netto rentebetalings en voorsiening vir waardevermindering.

Die berekening van die vergoeding van werknemers word gebaseer op maandelikse en kwartaallikse gegewens van lone en salarisse betaal aan werknemers in feitlik al die sektore van die ekonomie, wat deur die Departement van Statistiek versamel en gepubliseer word. Tans omvat hierdie reekse meer as tagtig persent van alle lone en salarisse wat in die nie-landbousektore van die ekonomie verdien word. Lone en salarisse wat deur die landbousektor betaal word, word deur die Departement van Landbou en Visserie geraam.

Die bruto bedryfsurplus van die **landbou en bosbou** word deur die Departement van Landbou en Visserie geraam deur die waarde van intermediêre goedere en dienste verbruik en die vergoeding betaal aan werknemers van die bruto ontvangste af te trek. Die bruto bedryfsurplus van die **mynwese, die fabriekswese en die handel** word geraam op grond van sensusresultate en kwartaallikse opnames van finansiële statistieke wat deur die Departement van Statistiek en die Reserwebank gedoen word. In die geval van **konstruksie** word die bruto bedryfsurplus verkry deur middel van interpolasie en ekstrapolasie van sensusresultate op grond van vaste investering in geboue en konstruksiewerke. Vir die sektor **elektrisiteit, gas en water** word die bruto bedryfsurplus

bereken uit inligting verkry van die belangrikste ondernemings hierby betrokke. In die geval van **vervoer, opberging en kommunikasie** word die bruto bedryfsurplus van die Suid-Afrikaanse Spoorwegadministrasie bereken uit die maandelikse publikasie van sy bedryfsresultate, terwyl dié van die Departement van Pos- en Telekommunikasiewese gebaseer word op statistieke wat aan die Reserwebank en die Departement van Statistiek verstrek word. Inligting aangaande die bruto bedryfsurplus van **finansiële instellings** word deur die Reserwebank van bankinstellings, bouverenigings en versekeringsmaatskappye verkry. In die geval van **vaste eiendom** word die bruto bedryfsurplus geraam op basis van 'n gekombineerde indeks bestaande uit die totale aantal wooneenhede en huis- en woonstelhuur. Die totale bruto binnelandse produk teen **faktorkoste** word verkry deur die vergoeding van werknemers en die bruto bedryfsurplus van die verskillende sektore bymekaar te tel.

Om die bruto binnelandse produk teen faktorkoste na **markpryse** om te skakel, word indirekte belasting bygetel en subsidies afgetrek van die ramings teen faktorkoste. Inligting aangaande hierdie twee poste word uit 'n ontleding van die owerheidsrekening deur die Reserwebank verkry. Om die bruto **nasionale** produk teen markpryse te verkry, word netto faktorbetalinge aan die res van die wêreld van die ramings van die bruto **binnelandse** produk afgetrek. Hierdie betalinge word uit betalingsbalansgegewens wat deur die Reserwebank saamgestel word, verkry.

Ramings van die bruto binnelandse produk teen konstante pryse word vir elke belangrike vertakking van die nywerheid gemaak. Jaartotale word verkry deur die sommering van kwartaallikse ramings. In die geval van **landbou en bosbou** word die dubbele defleringsmetode gebruik. Die bruto produksie en intermediêre besteding teen heersende pryse word afsonderlik deur toepaslike prysindekse gedefleer, en die toegevoegde waarde teen konstante pryse word as die verskil tussen bruto produksie en die intermediêre besteding bereken. Die reële toegevoegde waarde van die **visbedryf** word bereken deur die ekstrapolasie van die basisjaarramings met behulp van toepaslike volume-indekse. Basisjaarramings van die toegevoegde waarde van die **mynbousektor** word deur middel van indekse van die fisiese volume van goud- en nie-goudmynbouproduksie ge-ekstrapoleer. Die basisjaarramings van die toegevoegde waarde van elk van die hoofsub-afdelings van **fabriekswese** word deur hulle ooreenstemmende indekse van fisiese volume van produksie ge-ekstrapoleer. Die aantal eenhede elektriese stroom opgewek word as aanwyser gebruik om die toegevoegde waarde van **elektrisiteit** in die basisjaar te ekstrapoleer. Die basisjaarramings van die reële toegevoegde waarde van **konstruksie** word ge-ekstrapoleer deur 'n indeks van reële vaste investering, wat verkry word deur die kapitaalinvestering teen heersende pryse met toepaslike prysindekse te defleer. In die geval van die **handel** word die basisjaarwaardes ge-ekstrapoleer deur middel van gede-

fleerde handelsomsetters wat verkry is deur die waarde van groot- en kleinhandelverkope deur middel van die toepaslike prysindekse te defleer. Volume-aanwysers word gebruik om basisjaarramings van die toegevoegde waarde van **vervoer en kommunikasie** te ekstrapoleer.

Basisjaarramings van die reële toegevoegde waarde van **finansies en versekering** word ge-ekstrapoleer deur toepaslike volume-aanwysers, wat bereken word deur 'n verteenwoordigende groep van die transaksies van die nywerheid deur middel van geskikte prysindekse te defleer. Die bydrae tot die reële bruto binnelandse produk in die basisjaar deur eienaars van **vaste eiendom** word deur middel van die totale aantal bestaande geboue ge-ekstrapoleer, terwyl die reële toegevoegde waarde van eiendomsagente en ontwikkelaars in die basisjaar ge-ekstrapoleer word deur 'n waarde-indeks van transaksies in vaste eiendom, gedefleer deur 'n prysindeks van konstruksie. Die reële toegevoegde waarde van **ander sakedienste** word verkry deur of die heersende prysramings deur toepaslike prysindekse te defleer, of deur die basisjaarramings met die aantal persone in diens van die betrokke sakedienste te ekstrapoleer. In die geval van **gemeenskaps-, maatskaplike en persoonlike dienste** word of die aantal persone in diens as 'n aanwyser gebruik om die basisjaarwaardes te ekstrapoleer, of die toegevoegde waarde teen heersende pryse met toepaslike prysindekse gedefleer. Omdat daar nie gepaste amptelike indekse van salaris- en loonskale bestaan nie, word die toegevoegde waarde van verskaffers van **regeringsdienste** in die basisjaar met die aantal persone in diens van die algemene owerheid ge-ekstrapoleer.

Private verbruiksbesteding

'n Groot aantal bronne word geraadpleeg om private verbruiksbesteding te raam. Besteding aan voedsel word deur die Departement van Landbou en Visserye geraam en hierdie berekenings is op hulle beurt weer op inligting aangaande die bemarking van die belangrikste landbouprodukte gebaseer. Verbruiksbesteding aan drank en tabak word deur middel van aksynsifers geraam. Ramings van besteding aan klerasie, skoeisel, meubels, toebehore, medisyne, ontspannings- en vermaaklikheidsgoedere, ens., word gebaseer op gegewens aangaande kleinhandelverkope wat deur die Departement van Statistiek ingesamel word. Die waarde van nuwe vervoertoerusting aangekoop, word verkry deur die aantal motorvoertuie en -fietse verkoop te vermenigvuldig met toepaslike pryse. Die lopende kostes van private motorvoertuie, soos brandstof, olie, bande en onderdele word bereken deur middel van gegewens aangaande die bedryfsinkomste van die motorhandel en inligting verkry van die Automobiël Assosiasie. Huur betaal word op die aantal wooneenhede en die gemiddelde huur van huise en woonstelle gebaseer. Die oorblywende deel van private verbruiksbesteding word op diverse reekse gebaseer, soos die inkomste van die Suid-Afrikaanse Spoorwegadministrasie, en die Departe-

ment van Pos- en Telekommunikasiewese, verkope van koerante en tydskrifte, salarisse, lone en toelaes betaal aan huisbediendes, die bedryfsresultate van gelisensieerde hotelle, die aantal dokters, tandartse ens., die hospitaalgelde wat aan die provinsiale administrasies toeval, die aantal sterftes en geboortes, ens.

Om die private verbruiksbesteding teen heersende pryse na konstante pryse om te skakel, word elke komponent herwaardeer teen basisjaarpryse en dan bymekaar getel om die totale private verbruiksbesteding teen konstante pryse te verkry. Waar moontlik word reële waardes bereken deur die basisjaarsyfers met geskikte volume-indeks te ekstrapoleer. Waar volume-indeks nie beskikbaar is nie, word toepaslike prysindekse gebruik om die betrokke waardes teen heersende pryse na reekse teen konstante pryse om te skakel. As nie een van bogenoemde metodes suksesvol toegepas kan word nie, word die algemene verbruikersprysindeks gebruik om die reekse te defleer. Laasgenoemde metode word egter slegs toegepas ten opsigte van 'n aantal items wat 'n baie klein deel van die totale private verbruiksbesteding uitmaak. Daar word van 'n groot aantal verskillende indekse gebruik gemaak, soos dié wat beskikbaar is vir die komponente van die verbruikers- en produksieprysindekse, kleinhandelverkope en die fisiese volume van fabrieksproduksie, sowel as van inligting wat regstreeks deur die Reserwebank ingesamel word.

Owerheidsverbruiksbesteding

Verbruiksbesteding deur die sentrale regering word voorlopig op uitreikings uit die Skatkisrekening gebaseer. Daarna word dit hersien op basis van geouditeerde verslae en inligting oor werklike besteding wat van die Departement van Statistiek verkry word. Die betrokke besteding van die provinsiale administrasies en dié van die plaaslike owerhede word saamgestel uit geouditeerde verslae, opgawes wat regstreeks aan die Reserwebank gemaak word en uit inligting wat deur die Departement van Statistiek versamel word.

Om reële syfers te raam, word 'n onderskeid tussen twee komponente gemaak, naamlik lone, salarisse en toelaes, en ander lopende uitgawes. Die basisjaarwaardes van lone, salarisse en toelaes word met die aantal persone in diens van die algemene owerheid ge-ekstrapoleer. Ramings van owerheidsbesteding aan goedere en ander dienste teen konstante pryse word verkry deur die besteding teen heersende pryse te defleer met 'n beswaarde indeks wat uit die produksiepryse van verskillende klasse van goedere en dienste saamgestel is.

Bruto binnelandse vaste investering

Die investering van openbare owerhede, bestaande uit die sentrale regering, provinsiale administrasies en plaaslike owerhede, en dié van openbare korporasies word geraam deur middel van geouditeerde verslae en opgawes wat aan die Reserwebank en die Departe-

ment van Statistiek verstrek word deur die Suid-Afrikaanse Spoorwegadministrasie, die Departement van Pos- en Telekommunikasiewese, die grootste openbare korporasies, al die provinsiale administrasies, en inligting wat verkry word uit 'n steekproef van die vernaamste regeringsdepartemente en plaaslike owerhede.

Wat die investering van die private sektor betref word die investering van die **landbou** deur die Departement van Landbou en Visserye geraam uit resultate van jaarlikse sensusverslae en kwartaallikse opnames. Vaste investering deur die **fabriekswese, mynbou en handel** (in die geval van handel slegs masjinerie en toerusting) word gebaseer op sensusresultate en kwartaallikse steekproefopnames van kapitaalluitgawes wat deur die Departement van Statistiek en die Reserwebank gemaak word. Ramings van investering in **woongeboue** en die besteding aan geboue deur die sektore **handel, private vervoer, finansiële instellings**, ens., word gebaseer op gegewens van die waarde van geboue voltooi in die metropolitaanse en sekere ander stedelike gebiede wat deur die Departement van Statistiek ingesamel word. **Oordragkoste** word gebaseer op die hereregte wat deur die sentrale regering ingevorder word en die waarde van transaksies in vaste eiendom.

Om die bruto binnelandse vaste investering teen heersende pryse na konstante pryse om te skakel, word die besteding teen heersende pryse volgens tipe bate vir elkeen van die nege ekonomiese sektore en die drie klasse instellings gedefleer om waardes teen basisjaarpryse te verkry. Hierdie gedefleerde waardes word daarna bymekaar getel om die totale bruto binnelandse vaste investering teen konstante pryse te verkry. In die geval van konstruksiewerke en woon- en nie-woongeboue word die ramings teen heersende pryse gedefleer met behulp van prysindekse van materiaal-insette en arbeidskoste vir elkeen van die drie tipes bates, aangepas vir meetbare veranderinge in die arbeidsproduktiwiteit. In die geval van vervoertoerusting, masjinerie en ander toerusting word die besteding teen heersende pryse gedefleer met afsonderlike indekse vir hierdie poste, gebaseer op inligting wat van die Departement van Statistiek verkry word.

Verandering in voorrade

Die verandering in landbouvoorrade en die veestapel word deur die Departement van Landbou en Visserye geraam uit landbousensusse en die resultate van korttermyn-opnames. Veranderinge in die mynbou-, fabriekswese- en handelsvoorrade word gebaseer op inligting verkry van sensusverslae en kwartaallikse opnames. Die verandering in diamant- en strategiese voorrade word bereken uit vertroulike inligting wat aan die Reserwebank verstrek word. Veranderinge in landbouvoorrade-in-die-handel word beraam uit gegewens verkry van landboubeheerrade en ko-operatiewe verenigings. Die verandering in voorrade word bereken as die verskil tussen die begin- en eindwaar-

des van die voorrade. Die beginsel van voorraadwaardering in sake-ondernemings se boekhouding verskil dikwels van die metode wat vir die doeleindes van nasionale rekeninge verlang word. Die waarde van voorrade in die boeke van sake-ondernemings verteenwoordig gewoonlik boekwaardes, terwyl die fisiese verandering in voorrade, gewaardeer teen die gemiddelde aankooppryse, vir die nasionale rekeninge benodig word. Die boekwaarde van nywerheids- en handelsvoorrade word derhalwe aangesuiwer voordat die werklike verandering bereken kan word. Die verskil tussen die verandering in die boekwaarde en die verandering in die aangesuiwerde waardes, word na verwys as die "aansuiwering vir voorraadwaardering."

In die geval van ramings teen konstante pryse word veranderinge in die landbou se veestapel teen konstante pryse verkry deur die veranderinge in die aantalle van die verskillende soorte lewende hawe te vermenigvuldig met 'n toepaslike gemiddelde basisjaarwaarde vir die betrokke klas lewende hawe. In die geval van nywerheids- en handelsvoorrade word die begin- en eindboekwaarde van voorrade gedefleer met die gemiddelde produksieprysindeks oor die laaste vyf en vier maande onderskeidelik, en die veranderinge in die gedefleerde waardes bereken. Veranderinge in reële landbouvoorrade-in-die-handel word verkry deur die fisiese verandering in die voorrade van die onderskeie klasse produkte teen toepaslike basisjaarpryse te waardeer. Die verandering in ramings teen konstante pryse van alle ander klasse voorrade word verkry deur die eindwaarde van die voorraad vir 'n spesifieke sektor met die gemiddelde produksieprysindeks vir die betrokke tydperk te defleer en deur die verandering in die gedefleerde voorraadsyfers van een tydperk na 'n ander te bereken.

Uitvoer en invoer van goedere en dienste

Ramings teen heersende pryse word gebaseer op betalingsbalansgegewens, wat deur die Reserwebank saamgestel word. Ramings teen konstante pryse word verkry deur die ekstrapolasie van basisjaarwaardes deur middel van toepaslike volume-aanwysers of deur deflering van die waardes teen heersende pryse met toepaslike prysindekse. So word die netto waarde van die gouduitvoer teen konstante pryse verkry deur die ekstrapolasie van die waarde in 1975 op basis van die aantal kilogramme fyn goud geproduseer, aangepas vir betalingsbalansdoeleindes. Die waarde van die goedere-uitvoer teen konstante pryse word bereken deur die waarde teen heersende pryse met 'n prysindeks te defleer wat uit die indekse van die gemiddelde eenheidswaardes van goedere-uitvoer saamgestel is. Die waarde van die uitvoer van dienste teen konstante pryse word verkry deur die deflering van die komponente van sodanige dienste teen heersende pryse met toepaslike indekse, soos vrag- en versekeringstariëwe, passasiersreisgelde en verbruikerspryse van toeristebesteding in die binnelandse ekonomie.

Die waarde van goedere-invoer teen konstante pryse word bereken deur die waarde teen heersende pryse met 'n prysindeks van die gemiddelde eenheidswaarde van die goedere-invoer te defleer. Die waarde van die invoer van dienste teen konstante pryse word verkry deur die komponente van sodanige dienste teen heersende pryse met 'n beswaarde prysindeks van poste soos vragtariewe, passasiersreisgelde en die verbruikerspryse van uitgesoekte oorsese lande te defleer.

Reële vaste kapitaalvoorraad

Die sogenaamde "voortdurende voorraadmetode" word vir die berekening van die reële vaste kapitaalvoorraad van Suid-Afrika gebruik. Die metode behels die sommering van reële netto vaste investeringsyfers, dit wil sê bruto vaste investering teen konstante pryse **min** voorsiening vir waardevermindering teen konstante pryse. Die metode van omskakeling van bruto binnelandse vaste investering teen heersende pryse na konstante pryse is reeds hierbo bespreek.

In die berekening van die voorsiening vir waardevermindering of kapitaalverbruik word sekere aannames omtrent die gemiddelde ekonomiese leeftyd van die verskillende bates gemaak. Die aanvaarde leeftye wissel van 80 jaar in die geval van konstruksiewerke in die landbousektor tot 8 jaar vir vervoertoerusting. Geen voorsiening vir waardevermindering word in die geval van die konstruksiewerke van die algemene owerheidsdepartemente gemaak nie. In laasgenoemde geval word aanvaar dat die ekonomiese lewe van hierdie konstruksiewerke onbepaald verleng kan word deur voldoende instandhouding en herstelwerk.

Op grond van hierdie aannames word die jaarlikse voorsiening vir waardevermindering teen konstante pryse bereken deur die konvensionele "reguitlynmetode" te gebruik. Volgens hierdie metode word die aanvanklike koste van 'n bate in gelyke bedrae oor die ekonomiese lewe van die bate afgeskryf. Die reële kapitaalvoorraad van, sê 1946, is verkry deur die jaarlikse reële bruto vaste investering vir 'n tydperk gelyk aan die ekonomiese lewe van die spesifieke tipe bate bymekaar te tel, en deur van hierdie totaal die geakkumuleerde voorsiening vir waardevermindering ten opsigte van hierdie tipe besteding oor dieselfde tydperk af te trek. Vir die daaropvolgende jare word die kapitaalvoorraad verkry deur die jaarlikse netto vaste investeringsyfer by die kapitaalvoorraad van die vorige jaar te tel.

Lopende inkome en uitgawe van geïnkorporeerde sake-ondernemings

Die belangrikste poste wat bereken word is die netto bedryfsurplus, inkome uit eiendom soos rente en dividende, en direkte belastinge. Maatskappybesparing verteenwoordig die verskil tussen lopende inkome en lopende uitgawe. 'n Volledige rekening word vir elkeen van die onderskeie soorte ekonomiese

bedrywighede saamgestel en dan bymekaar getel. Die hoofbronne van inligting is die resultate van sensusopnames van die Departement van Statistiek, kwartaalike steekproefopnames wat deur die Departement van Statistiek en die Reserwebank gemaak word en finansiële inligting wat uit maatskappyverslae verkry word.

Seisoensaansuiwing van nasionale rekeninge-gegewens

Die meeste nasionale rekeninge-reekse wys 'n duidelike seisoenspatroon, wat voortvloei uit faktore soos weerstoestande, wat die produksie en bemarking van landbou-oeste beïnvloed; openbare vakansiedae en feesdae soos Kersfees en die Paasnaweek, wat die persoonlike besteding beïnvloed; belastinginvoerings op spesifieke datums in die jaar, wat 'n invloed op die owerheidsinkomste en -besparing het; dividend- en belastingbetalings wat maatskappybesparing beïnvloed; ens. In hierdie gevalle word die basiese onderliggende neigings in die gegewens in 'n sekere mate deur die gereelde seisoenspatroon verberg. Om hierdie rede is dit wenslik om die invloed van die seisoensbewegings in die verskillende reekse uit te skakel. Nieteenstaande die probleme wat aan die tegniek van aansuiwing van gegewens vir seisoensinvloede verbonde is, voorsien die aangesuiwerde totale 'n meer getroue beeld van die basiese ekonomiese toestand as die onaangesuiwerde gegewens. Indien die seisoensaangesuiwerde kwartaalike gegewens met vier vermenigvuldig word, word 'n aanduiding verkry van die moontlike omvang van die jaartotaal, op die veronderstelling dat die vlak van die ekonomiese bedrywigheid van die spesifieke kwartaal ook gedurende die daaropvolgende drie kwartale sal voortduur. Die totale wat op hierdie wyse verkry word, word na verwys as "seisoensinvloed uitgeskakel, teen jaarkoerse."

Uit 'n aantal beskikbare metodes vir die seisoensaansuiwing van ekonomiese tydreekse, het die Reserwebank die X-11 Variant van die "U.S. Census Method II" gekies. Hierdie metode, wat tans algemeen dwarsdeur die wêreld gebruik word, is in besonderhede bespreek in die **Bylaag** tot die Bank se **Kwartaalblad** van September 1971, getiteld "'n Statistiese aanbieding van uitgesoekte ekonomiese aanwysers van Suid-Afrika vir die tydperk 1946 tot 1970."

1. Lopende besteding aan salarisse en lone en aan goedere en ander dienste van nie-kapitale aard van die algemene afdelings, maar nie die sake-ondernemings nie, van openbare owerhede. Openbare owerhede sluit in sentrale owerhede, provinsiale administrasies en plaaslike owerhede van die gedefinieerde gebied en ander liggame soos be-
staansbeveiligingsfondse, S.A. Ontwikkelingstrustfonds, WNNR, ens.
2. Ná aansuiwering ten opsigte van voorraadwaardering.
3. Insluitende respos.

1. Current expenditure on salaries and wages and on goods and other services of a non-capital nature of the general departments, but not the business enterprises, of public authorities. Public authorities include central authorities, provincial administrations and local authorities of the defined territory and other bodies such as social security funds, S.A. Development Trust Fund, CSIR, etc.
2. After inventory valuation adjustment.
3. Including residual item.

1. Lopende besteding aan salarisse en lone en aan goedere en ander dienste van nie-kapitale aard van die algemene afdelings, maar nie die sake-ondernemings nie, van openbare owerhede. Openbare owerhede sluit in sentrale owerhede, provinsiale administrasies en plaaslike owerhede van die gedefinieerde gebied en ander liggame soos bestaansbeveiligingsfondse, S.A. Ontwikkelingstrustfonds, WNNR, ens.
2. Na aansuiwering ten opsigte van voorraadwaardering.

1. Current expenditure on salaries and wages and on goods and other services of a non-capital nature of the general departments, but not the business enterprises, of public authorities. Public authorities include central authorities, provincial administrations and local authorities of the defined territory and other bodies such as social security funds, S.A. Development Trust Fund, CSIR, etc.
2. After inventory valuation adjustment.

1. Lopende besteding aan salarisse en lone en aan goedere en ander dienste van nie-kapitale aard van die algemene afdelings, maar nie die sake-ondernemings nie, van openbare owerhede. Openbare owerhede sluit in sentrale owerhede, provinsiale administrasies en plaaslike owerhede van die gedefinieerde gebied en ander liggame soos be-
staansbeveiligingsfondse, S.A. Ontwikkelingstrustfonds, WNNR, ens.
2. Insluitende respos.

1. Current expenditure on salaries and wages and on goods and other services of a non-capital nature of the general departments, but not the business enterprises, of public authorities. Public authorities include central authorities, provincial administrations and local authorities of the defined territory and other bodies such as social security funds, S.A. Development Trust Fund, CSIR, etc.
2. Including residual item.

1. Lopende besteding aan salarisse en lone en aan goedere en ander dienste van nie-kapitale aard van die algemene afdelings, maar nie die sake-ondernemings nie, van openbare owerhede. Openbare owerhede sluit in sentrale owerhede, provinsiale administrasies en plaaslike owerhede van die gedefinieerde gebied en ander liggame soos bestaansbeveiligingsfondse, S.A. Ontwikkelingstrustfonds, WNNR, ens.

1. Current expenditure on salaries and wages and on goods and other services of a non-capital nature of the general departments, but not the business enterprises, of public authorities. Public authorities include central authorities, provincial administrations and local authorities of the defined territory and other bodies such as social security funds, S.A. Development Trust Fund, CSIR, etc.
