South Africa's national accounts, 1946 to 1990*

1. Introduction

In this supplement to the *Quarterly Bulletin* revised national accounts data are made available for the calendar years from 1946 to 1990 and for the calendar quarters from 1960 onwards. Revisions became necessary mainly because of the Republic of Namibia gaining independence on 21 March 1990. The national accounts statistics of the South-West African/Namibian economy were included in South Africa's national accounts up to the June 1990 edition of the *Quarterly Bulletin* of the Reserve Bank. The territory covered by the revised national accounts statistics, as presented in this supplement, comprises the Republic of South Africa and the Republics of Transkei, Bophuthatswana, Venda and Ciskei. Other revisions stemmed, *inter alia*, from the latest results of the Census of Manufacturing, revised public sector data, other more finalised and more up-to-date information and minor adjustments made for the sake of statistical consistency.

The sources of information and methods applied in compiling national accounts statistics are described more comprehensively in this supplement in order to facilitate the interpretation of the data. In Section 2 the South African system of national accounts is described briefly, followed in Section 3 by an outline of the production account. In Section 4 the national income and appropriation account, capital finance account and external account are explained. Annexure A summarises systematically the national income and product accounts for the year 1990. Annexure B provides a description of the principal sources of data and methods of calculation.

Annexure C contains the revised annual and quarterly national accounts data as mentioned above.

2. The South African system of national accounts

2.1 International standardised systems

There are two internationally recognised systems for the compilation of macro-economic accounts. They

are the *System of National Accounts* (SNA) of the United Nations Organisation for market economies, and the *System of Material Product Balances* (MPS), developed by the Council for Mutual Economic Assistance for countries with centrally planned economies.

The first manual on a system of national accounts was published by the United Nations Organisation in 1952. This manual was subsequently improved and extended, and in 1968 a revised version was released as the now well-known *System of National Accounts* (SNA). The SNA provides internationally accepted methods, classifications and rules for the compilation of macro-economic accounts for market economies. The SNA¹, with minor modifications in certain areas, still provides the cornerstone for national accounting in all Western countries. Further revisions are envisaged and a new edition is to be released shortly. No far-reaching changes are, however, foreseen.

2.2 Economic activities

The compilation of macro-economic accounts requires a definition of the concept of economic activity. All activities that result in the production of goods and services for sale on markets by the modern and the informal private sectors, public corporations and government enterprises, are regarded as economic activities. The government's activities in the areas of public administration, the maintenance of law and order, and the provision of health, education and social services are also counted as economic activities, even though the products of these activities are not sold on any markets. Non-market activities performed by private non-profit organisations, such as the provision of social services, the activities of sports clubs and the rendering of private educational services, also form part of economic activities.

Some borderline cases have already been dealt with by the SNA. At present the SNA recommends the inclusion in the national accounts of non-market economic activities if these activities are similar to operations which result in goods and services that are also sold in the market. Examples of such non-

* The text of this supplement was compiled by Messrs J. van Dyk and J.W. Prinsloo. The statistical tables were prepared under the supervision of Mr J.W. Prinsloo with valuable assistance by Messrs A.J.H. Castelein, H. Smith, H. Wagner, M.J. Bruwer, L.R. Myburgh and Mrs C.J. van der Dussen of the National Accounts Division of the Reserve Bank's Economics Department. Comments and assistance given by Mr G. Mills and his staff at the Central Statistical Service are hereby also acknowledged.

¹ The SNA is supplemented by a number of other handbooks and manuals. Prominent among them are, from the United Nations Organisation:
• Input-Output Structure (1973);
• Balance of Payments Manual (1977);
• National Accounts at Constant Prices (1979);
• Accounting for Production: Sources and Methods (1986);
• Public Sector Accounts (1988); and
from the International Monetary Fund:
• Government Finance Statistics (1986)

market activities are the construction of buildings by households and enterprises for their own use, the production of crops and other agricultural goods for consumption on farms and the services derived from owner-occupied dwellings. Unpaid services rendered by housewives and other household members are, however, excluded.

2.3 Classifications

A set of national accounts provides a comprehensive and detailed recording of production, income, expenditure and financial flows and of stocks of fixed capital goods and of inventories in a systematic and consistent manner.

Flows are classified in four categories and are

recorded in four main or core accounts, whereas stocks are presented in a consolidated balance sheet of the nation.

The flows in these accounts are based on the principles of double-entry bookkeeping. Every transaction appears once in the account of the payer and once in the account of the recipient of the payment concerned.

The entries in the four main accounts represent aggregated totals of a substantial number of individual transactions. A disaggregation of these totals allows sub-totals to be assigned to accounts for various kinds of transactions, various kinds of transactors, or various kinds of economic activities.

The grouping of transactors follows two broad approaches. Firstly, transactors are classified according to the general nature of their activities, which may either involve production or consumption and accumulation (or saving) (see Table 2). Secondly, in a further classification, transactors are categorised according to the kinds of goods produced or services rendered (see Table 3). A guide for such a classification is provided by the Standard Industrial Classification of all Economic Activities.²

The classification of transactors in terms of the production approach is guided by the decision-making rules of the producer units. Transactors are then grouped according to whether they are profit-seeking or non-profit-motivated, whether they produce private or government goods and services, and whether they are incorporated or unincorporated.

The classification of transactors for the consumption and accumulation approach deals with the source and utilisation of income, the financing of capital spending, the accumulation and financing of capital, and balance sheets.

Other classifications made in the system of national accounts include private consumption according to object and according to type of expenditure, government consumption by function, and fixed investment by type of asset.

These so-called "major divisions" are in turn divided into "divisions", "major groups" and "sub-groups."

2.4 Constituent accounts of the system of national accounts

Table 4 provides an outline of the System of National Accounts and shows its principal constituent accounts and tables.

The gross domestic product and expenditure account is a consolidated statement of the production of goods and services and of expenditure on goods and services.

The national disposable income and appro-

priation account consolidates the income and expenditure of the personal or household sector, corporate sector, and government sector.

The capital finance account is a consolidated statement of gross and net fixed investment outlays, changes in inventories, and the financing of gross investment spending.

The external account records all trade and services transactions with the rest of the world and capital flows across international borders.

The consolidated balance sheet is not yet available for South Africa, but some constituent components have been calculated, namely the fixed capital stock and foreign assets and liabilities.

2.5 Notes on the compilation of South Africa's national accounts

Some general practices are followed in the compilation of South Africa's national accounts.

2.5.1 The region covered by the accounts

The region covered by the national accounts of South Africa is known as the SATBVC region and includes the republics of South Africa (inclusive of the six self-governing national states), Transkei, Bophuthatswana, Venda and Ciskei. Changes in the international status of territories within this geographical region (for example, the gaining of independence by Namibia, Botswana, Lesotho and Swaziland) have usually been accompanied by a revision of historical data to ensure a consistent time series of national accounts data. However, where institutional changes occur (such as the privatisation of Sasol and Iscor), such a change in status (as from

² Central Statistical Service, *Standard Industrial Classification of all Economic Activities*, (Fourth Edition), Pretoria, 1988.

a public corporation to a private-sector organisation) is reflected in the data only as from the date on which such a change has come into effect.

2.5.2 Quarterly estimates and seasonal adjustments
In the compilation and analysis of quarterly estimates it is important to note that most national accounts series show a distinct seasonal pattern. Seasonal fluctuations in national accounts data arise from factors and events that occur regularly, and mostly at fairly fixed times or within fairly fixed periods, in the course of successive calendar years. Examples of such regularly recurring annual events are seasonal changes in weather conditions, public holidays, festive, seasonal and school vacations; they are normally accompanied by changes in people's production and consumption activities. Seasonal influences have to be removed from the national accounts time series data if the "basic" or "underlying" tendencies in these data are to be brought to light. In the published South African national accounts statistics, seasonal influences have, therefore, been eliminated from the basic data as accurately as possible.

Seasonal adjustment of time series is complicated by the fact that, firstly, seasonal factors do not usual-

ly express themselves with complete regularity and with fully unchangeable absolute or relative strength from year to year. Secondly, the patterns of seasonal variation may themselves shift over time. Among the non-man-made causes of seasonal fluctuations, the seasonal changes in, for example, weather conditions — such as the onset of summer rains or winter frosts — may vary "randomly" quite substantially and largely unpredictably from one year to the next. This may, for example, cause the harvesting of the South African maize crop to shift from "early" (i.e. mostly in the second quarter) in any one calendar year, to "late" (i.e. mostly in the third quarter) in the ensuing year.

Among the man-made causes of seasonal fluctuations, new public holidays may be proclaimed, or new school holiday periods instituted. Changes in customs and conventions (or in legislation) may give rise to new patterns of seasonal variations or even entirely new seasonal elements (such as a regular annual period of wage negotiations, which may also be a period of increased labour strikes and stayaways). In the past three years from 1988 onwards, the seasonal pattern in government expenditure was found to have shifted away from heavy spending in the first quarter of each calendar year (i.e. in the

final quarter of each *fiscal* year), and much reduced expenditure in the second quarter, to heavy spending in the second quarter. While seasonal adjustments obviously remain called for even in such conditions, statisticians have, during the transitional periods concerned, no option but to make these adjustments in accordance with their best estimates of the extent of the shift in the seasonal pattern that has already taken place, while waiting for more stable and conclusive patterns to emerge more unequivocally. In the case of the harvesting of agricultural crops, separate sets of seasonal adjustment factors are determined for "early" and "late" crops respectively.

2.5.3 Time of recording

Transactions are generally recorded at the moment purchases are made and legal possession of the item is taken, irrespective of delays in the payment for or delivery of the goods or services concerned. In the case of a *hire-purchase* arrangement, the purchase of the article concerned is considered to have taken place at the time the *hire-purchase* contract was signed.

When *machinery and equipment* are produced on order, the eventual buyers are assumed to take ownership of the goods concerned at the time when the manufacturing of these goods is completed. "Progress payments" in respect of orders in process of execution are entered in the capital finance account as advances to the manufacturers. In the case of construction of *buildings* and other construction works, however, the buyers are considered to take possession progressively and on a running basis of all work done up to final completion of the entire building or construction project.

The production of *gold* is recorded as exports of gold at the time of its production.

2.5.4 Valuation

Goods and services are valued at purchasers' values, including transport and installation charges and indirect taxes less subsidies, but excluding interest on consumer or other debt that may have been entered into for financing the purchase concerned. Capitalised interest is not included in the value of capital formation. Interest does, however, form part of income from property.

The compilation of the national accounts on an accrual basis (i.e. the assumed recording of a transaction the moment the relevant purchase is made) and at purchasers' values gives rise to some practical problems, because transactions are normally valued on a cash basis and tax expenditures do not form part of the national accounts.

2.5.5 Constant prices

The annual and quarterly compilation of national accounts data generates a time series for each of the

elements of the system. Observed changes (increases or decreases) in the time series may reflect changes in quantities as well as in prices. In order to distinguish between changes in prices and changes in quantities, *all flows in the production account are estimated at both current and constant prices*.

Two alternative approaches are followed to construct constant-price series. The direct approach is to extrapolate base-year values using quantity series (physical volumes of production or volume of sales). The *indirect deflation approach* is to divide series at current prices by relevant price indices.

2.5.6 Changing the base year

The recalculation of constant-price series at new base-year prices and weights, is made approximately every five years. In South Africa series have been based successively at constant 1963, 1970, 1975, 1980 and 1985 prices and weights. Periodic revisions of the base year are necessary because changes in relative prices and in the "structure" of the economy occur over time. In order not to disturb previously calculated growth rates (i.e. in order to maintain growth rates of individual constant-price time series prior to a set year) in volume series during the base year change-over calculation, sub-totals and totals for years before a set year are converted to new base year prices independently of the changes in their constituent components.

2.6 Revisions

In a statistician's "ideal" world, all the basic data needed to construct the national accounts would be available and be collected as frequently and in as much detail as would be needed for compiling the national accounts without having to make use of guesswork or estimates. In practice this is unfortunately not possible; the compilers of the national accounts therefore have to make the fullest possible use of all information that is available. It has been said that "The essence of national accounting is *integration*: bringing together data from many different sources and arranging them so that they present a coherent picture of the whole economy. This requires persistence in tracking down possible data sources, and ingenuity and imagination in using them. National accounting, to a greater degree than other branches of statistics, is an art, not a science."³

Given these constraints, a two-stage technique has often been shown to be the most efficient way in which statistical resources can be harnessed. Detailed data, specifically designed to meet anticipated needs (which may be, and usually are, wider than simply compiling national accounts), are collected at

³ United Nations, *Handbook of National Accounting. Accounting for Production: Sources and Methods*, New York, 1986, p.10.

infrequent intervals, and from these data "benchmark" estimates are made. Between benchmark years, series are extrapolated on the basis of much less detailed indicators of movement. When new benchmark and revised data are collected, the extrapolated figures for the intervening years and quarters have to be verified and adjusted.

The methods of extrapolation rely on one or two general techniques. The first applies the percentage change observed in an indicator series to benchmark figures; the second applies benchmark percentage distributions to aggregates for later periods.

Specific sources and estimation techniques that have been proved useful in estimating various components are discussed in the sections that follow.

3. Production account

3.1 Definitions and general principles

The gross domestic product and expenditure account (see Annexure B) forms a prominent part of the System of National Accounts. This account deals with the supply of and uses (demand) for final goods and services.

The supply of final goods and services is shown on the "supply" or production side of the account and is equal to the sum of outputs or production of resident producers and imports. (The latter is shown as a negative total on the expenditure side.) Disaggregations of the totals on this side of the account are shown in the tables on gross domestic product by kind of economic activity, in the input-output tables, and in regional estimates. In this publication the tables showing the gross domestic product according to various kinds of economic activity are published.

The final uses of goods and services, which consist of final consumption expenditure, gross capital formation and exports, are shown on the "final uses" (expenditure) side of the account. Disaggregations are provided in respect of consumption expenditure, gross capital formation, and exports.

The production account reflects the three approaches to the estimation of the gross domestic product (GDP), namely the income method, the production method and the expenditure method.

3.1.1 The income method

In accordance with this method of calculation, the gross domestic product [GDP(I)] is calculated in the following manner:

- Remuneration of employees
- + net operating surplus
- + provision for depreciation (consumption of fixed capital)
- = GDP at factor cost
- + indirect taxes net of subsidies
- = GDP(I) at market prices

3.1.2 The production method

In accordance with the production method, the gross domestic product [GDP(P)] is determined as the sum of the value added of the various sectors, calculated as:

- Gross output (turnover)
- intermediate inputs
- = GDP(P)

3.1.3 The expenditure method

The expenditure on gross domestic product [GDP(E)] shows what becomes of the output once it has been produced. It is calculated by adding up the final uses to which output is devoted:

- Private consumption expenditure
- + government consumption expenditure
- + gross private and government fixed investment
- = gross domestic final demand
- + change in inventories
- = gross domestic expenditure (GDE)
- + exports of goods and non-factor services
- imports of goods and non-factor services
- = GDP(E)

Theoretically these three estimation methods as in 3.1.1, 3.1.2 and 3.1.3, should provide the same gross domestic product. Unfortunately all flows and stocks in the economy cannot be measured exactly; in consequence, the totals produced by 3.1.1, 3.1.2 and 3.1.3 will normally not coincide fully other than by pure chance. For this reason, the so-called "residual item" is allowed for on the production and expenditure accounts. At current prices it is derived as the difference between the [GDP(I)] and [GDP(E)] estimates and at constant prices between the GDP(P) and GDP(E) estimates.

3.2 The deconsolidation of expenditure on the gross domestic product [GDP(E)]

The gross domestic product is calculated by adding up the individual domestic spending components. The process starts with the preparation of smaller "building blocks" in each expenditure category. These "building blocks" are then fitted into the larger system in accordance with the various definitions and requirements. The principal source data and estimating methods of the different building blocks vary greatly from block to block. For this reason it is not feasible to discuss all the building blocks in full. In order to form an understanding of the methods applied, the calculation of the various components of expenditure is firstly discussed below, namely: private consumption expenditure, government consumption expenditure, fixed investment expenditure, inventories, and imports and exports.

3.2.1 Private consumption expenditure

3.2.1.1 Definition

Private consumption expenditure measures the sum of final consumption expenditure on goods and services by resident households, including private non-profit organisations.

The *final consumption expenditure of households* consists of all outlays on new goods and services, minus net sales of second-hand goods to other sectors. Finance costs of households are not included in private consumption expenditure, but form part of transfers of property income. Two concepts of household final consumption expenditure can be distinguished, namely final consumption expenditure *in the domestic market* and final consumption expenditure of *resident households*. Consumption expenditure in the domestic market consists of the expenditure on domestically available consumer goods and services by both residents and non-residents ("domestically available" goods and services may include imported goods and services). Consumption expenditure of resident households can be derived from this total by adding direct purchases which resident households make abroad and deducting purchases by non-resident households in the domestic market. The *national accounts of South Africa reflect the consumption expenditure of resident households only*. This point is important to the extent that relatively major purchases of consumer goods and services are made in South Africa by migratory workers from other countries who have found employment in the South African economy.

The *final consumption expenditure of private non-profit institutions* is equivalent to the producer cost of the services and goods which the non-profit institutions produce.

3.2.1.2 Classification

In essence three classifications are made of private consumption expenditure. *Firstly*, such expenditure is classified according to the nature of the items purchased, i.e. whether these items are durable, semi-durable or non-durable goods, or services. Semi-durable goods differ from durable goods in that their expected lifetime, which will normally be one year or somewhat more, is often significantly shorter, and their purchasers' value is mostly substantially less, than that of durable goods. Non-durable goods normally have a lifetime of less than one year. The classification of goods according to their degree of durability is valuable for such purposes as assessing households' stock of durable goods and for cyclical analyses of consumer demand. There is also a presumption that wealthier households, or the average household in the world's wealthier economies, devote a relatively larger proportion of their total consumption expenditure to

durable consumer goods.

Secondly, consumption expenditure is classified according to the *object or purpose* of the expenditure, i.e. in accordance with the international standard trade classification. This classification provides information for studies on consumer demand and welfare.

Thirdly, consumption expenditures are classified according to the *kind of economic activity* engaged by the industry in which the relevant commodities are produced, i.e. in accordance with the *Standard Industrial Classification of all Economic Activities*. This classification is provided in the input-output tables and is useful for sectoral analyses.

3.2.1.3 Principal sources of data and methods of calculation

Although more detail is provided in Annexure A regarding the sources of data and the methods of calculation, the following general approach is followed in calculating private consumption expenditure:

- For benchmark years the quinquennial survey of household expenditure in the various metropolitan regions of the Republic of South Africa, national states and TBVC countries is used to estimate the average household's expenditure on a specific good in a certain region. This average value per household is then multiplied by the number of households according to the population census to obtain total expenditure on that good. This method ensures that a large part of the informal economy's production is included in private consumption expenditure.
- For *in-between years* two separate methods, the *commodity-flow*⁴ and *retail-control* methods are used in conjunction. Estimates based on the input-output tables are used for the commodity-flow calculations, and an extrapolation according to the monthly retail trade sales is used for the retail-control method.
- *Quarterly estimates* are obtained by means of extrapolation of benchmark estimates. These extrapolations are prepared from the retail trade sales published in the monthly survey of retail trade by the Central Statistical Service. In addition, the use of data published by the Retailer Liaison Committee and other appropriate surveys are used to confirm the validity of the extrapolated results.
- *Constant-price estimates* are obtained by deflating each of the different current-price components by an appropriate element of the consumer price index.

⁴ The commodity-flow method refers to an analysis that uses information about the suppliers of goods and services, and the identification of those items that are entirely or partly used for final consumption of households, to estimate consumption expenditure in the domestic market.

3.2.1.4 Important categories of private consumption expenditure

- *Expenditure on personal transport equipment*, such as new motor cars and mini-buses, is estimated quarterly by multiplying the number of vehicles sold to final users (adjusted for cars to be used for business purposes) by the average prices of the various types of vehicles. The estimate of the number of vehicles sold is validated through a check against the number of new motor cars registered. Annual figures are obtained as the sums of the quarterly estimates. Annual totals are compared with those that have been obtained by the commodity-flow method in the compilation of the input-output tables. Constant-price estimates are obtained by using the number of vehicles sold as extrapolator and the derived deflator is compared with the corresponding component of the consumer price index.

A problem arises from the fact that a part of the outlays on motor vehicles by businesses is not undertaken for capital expenditure purposes, but is intended as fringe benefits to employees. Strictly speaking, cars bought for the latter purpose should be classified as remuneration of employees and as consumption expenditure on durable goods. It is, however, difficult to separate motor cars sold for purposes of fixed investment from motor cars sold for purposes of employee remuneration, because such information is not obtainable separately. Estimates can, however, be obtained from information furnished to the Receiver of Revenue.

The value added by used-car traders is by definition a part of private consumption expenditure. It is estimated by multiplying the number of used cars registered by the average trade margin charged by the used-car trade.

- Consumption expenditure on food, beverages and tobacco is estimated quarterly by the Department of Agriculture. The annual figures obtained in this way are checked against the quinquennial survey of household expenditure, the retail sales survey and the commodity-flow method used in the compilation of the input-output tables. For constant-price estimates, the current-price estimates are deflated by the relevant components of the consumer price index.

A problem encountered in calculating spending in this category arises from production for own consumption and, more specifically, from subsistence farming in the rural regions. The Department of Agriculture compiles estimates of this form of expenditure from several sources of information.

- Private consumption expenditure on petroleum products is calculated by multiplying the physical quantities purchased in the various regions, of the country by the indices of the retail prices of such products in these regions. This calculation is verified for benchmark years by using the results of the sur-

vey on household expenditure and by checks against information obtained from the input-output tables.

Constant-price estimates are arrived at by using the quantity of sales as an indicator. The deflator is then compared with the corresponding component of the consumer price index. A problem encountered in this area is how to determine the value of retail sales used as intermediate inputs in production processes. An analysis of input-output flows provides the basis for distinguishing between final consumption and intermediate consumption.

- Expenditure on gross rent covers all rent in respect of dwellings — actual and, in the case of owner-occupied houses, imputed — and includes taxes on property, payments for sanitary services and outlays for repairs and maintenance. Rents in respect of secondary dwellings such as seaside houses, cottages and chalets, are also included in this category. The benchmark for outlays on gross rent was calculated by multiplying the housing stock (as determined in the extended decennial population census) with the average annual rental paid (as quantified by the Central Statistical Service in the household and domestic servants survey). Quarterly estimates are based on residential capital stock and average rental figures. The real capital stock is used as an indicator for constant-price estimates.

- The most difficult part of estimating private consumption expenditure is encountered when determining expenditure on other services. It is important to note that in the case of rent, wages of domestic servants, household services, entertainment, recreational and cultural services and personal care services, the value added as estimated for the gross domestic product should be equal to the consumption estimates. It is also important to note that these consumption outlays, as well as expenditure on hospital care and other medical services, are not subdivided into spending components such as food, lodging or other goods and services.

3.2.2 Consumption expenditure by general government

Consumption expenditure by general government is calculated as the value of the gross output of the producers of government services less the value of government sales. It is estimated from the government's production account in the following way:

$$\begin{aligned} & \text{Intermediate consumption} \\ & + \text{compensation of employees} \\ & + \text{consumption of fixed capital} \\ & - \text{sales of government services} \\ & = \text{consumption expenditure by general government} \end{aligned}$$

The various public-sector accounts are estimated in accordance with the recommendations of the *Government Finance Statistics Manual* of the

Table 5**Producers of government services – production account****At current prices**

R billions

Cost of production	1985	1990	Output	1985	1990
Intermediate consumption	10,3	21,2	Consumption expenditure by general government	23,8	50,5
Compensation of employees	14,7	31,9	Fees received for sale of government services	2,0	4,1
Consumption of fixed capital.....	0,8	1,5	Gross output	25,8	54,6
Gross input	25,8	54,6			

International Monetary Fund and the *Public Sector Accounts Handbook* of the United Nations Organisation.

Intermediate consumption consists of purchases of goods and non-labour services. The composition and the size of intermediate consumption vary considerably between different types of services. Defence, for example, usually consists of expenditure on equipment and supplies for the armed forces. Other government services where intermediate consumption forms a substantial part of total outlays are health and welfare services. In departments of which the functions are largely of a regulatory or planning nature, intermediate consumption will consist mainly of items such as telephone charges, rent, stationery, computer expenses and cost of travel. In calculating intermediate consumption at constant values, current values are deflated by relevant components of the production price index.

Compensation of government employees, as included in government consumption expenditure, is a contra-entry of the item which is included in gross domestic product as remuneration of employees. In order to determine compensation of employees at constant values, base-year estimates are extrapolated using employment figures.

Consumption of fixed capital is estimated at replacement cost. It is, however, calculated for general government buildings only and not for roads and structures such as bridges and dams. Plant, machinery and vehicles, are classified as intermediate inputs. The calculation of consumption of fixed capital is discussed in more detail in the section on the determination of the capital stock.

"Sales of government services" refers essentially to those transactions in goods and services, as provided by general government bodies, where a clear link exists between the payment for and the acquisition of the goods or services concerned; however, the decision to make the payment must be voluntary. Examples of such services are charges in respect of public hospitals and schools. *Compulsory payments*, such as payments of fees for passports, driv-

ing tests or licences are included under "compulsory fees and penalties" and are not considered to represent sales. Sales of government services at constant value are estimated by dividing nominal spending totals by appropriately constructed price deflators.

3.2.3 Gross domestic fixed investment

3.2.3.1 Definition

Gross domestic fixed investment represents expenditure on new, durable and productive assets which have a life expectancy extending beyond the year in which the expenditure takes place and which may, therefore, be expected to contribute to future production processes.

Gross fixed capital formation consists of the outlays of private and public producers on new tangible objects which do not enter directly as intermediate consumption into the production process. The fundamental distinction between intermediate consumption and capital formation is whether the goods or articles concerned are considered to be used up during an accountancy period or whether they will yield benefits in the future.

Work in progress on uncompleted heavy machinery and equipment is included in gross domestic investment and forms part of the stock of producer goods. Work put in place on structures is included in fixed capital outlays at the unit for which the construction is carried out. However, outlays on research and development do not form part of capital formation, but are included in intermediate consumption. Similarly, expenditure on current repair and maintenance of fixed assets is also regarded as intermediate consumption. However, significant alterations, additions and replacements are classified as fixed capital formation if the newly incorporated parts have an expected lifetime of one year or more, such as the replacements of engines of trucks and alterations to buildings.

3.2.3.2 Classification

Gross domestic fixed investment is classified by type

of economic activity, type of organisation and type of asset. The classifications by type of economic activity and by type of organisation correspond to those of other national accounts aggregates and have already been discussed. In the classification by type of asset the following categories are normally distinguished:

- residential buildings;
- non-residential buildings;
- other construction and land improvements;
- transport equipment; and
- machinery and equipment.

Investment in *residential buildings* consists of the value of work put in place on the construction of buildings which are entirely or primarily dwellings (houses and flats); expenditure on *major alterations and additions* to these buildings; and *transfer and similar costs* in respect of the purchase (or sale) of existing residential buildings. Included is the installation of new permanent fixtures such as fixed stoves, central heating, air conditioning, lighting, plumbing and water-supply facilities, and all other fixed equipment customarily installed before dwellings are occupied.

Investment in *non-residential buildings* consists of the value of work put in place on buildings and structures which are entirely, or primarily, for industrial or commercial use; outlays on non-residential government buildings such as schools, hospitals and administration buildings; outlays on major alterations of and additions to these buildings and structures; and *transfer and similar costs* in respect of purchases (or sales) of existing non-residential buildings. Examples of private non-residential buildings are factories, warehouses, office buildings, stores, restaurants, hotels, garages and farm buildings. Also included are outlays on the installation, alteration and improvement of these structures.

Fixed investment on *other construction and land improvement* comprises the value of work put in place in respect of the construction and major alteration or renewal of works, such as permanent roads, bridges, harbours, car parking facilities, airports, pipelines, oil-wells, mine-shafts, dams and drainage.

Fixed investment on *transport equipment* includes the purchasers' value of new completed ships, aircraft, railway rolling stock, trucks and motor vehicles and outlays on major alterations or improvements to existing transport equipment.

Fixed investment in *machinery and equipment* includes the purchasers' value of new durable goods not elsewhere classified, such as agricultural machinery; power-generating machinery; computers; office machinery, equipment, furniture and furnishings; art objects; metal working, mining, construction and other industrial machinery; cranes and forklift equipment; durable containers; equipment and instruments used by professionals; and

equipment, furnishings and furniture for use by, *inter alia*, hotels, boarding houses, restaurants and hospitals. Items of small value, such as hand tools and inexpensive office desk equipment, are treated as current expenditure.

3.2.3.3 Principal sources of data and methods of calculation

The following general approach is followed in determining gross domestic fixed investment:

- For benchmark years fixed investment is calculated by using census results published by the Central Statistical Service. Estimates of investment in buildings are verified against the value of buildings completed, as surveyed monthly by the Central Statistical Service.
- Estimates for other years and quarterly estimates are determined by means of extrapolation and interpolation based on information obtained from quarterly sample surveys of financial statistics collected by the Reserve Bank and the Central Statistical Service. These estimates are verified by the commodity-flow method when compiling input-output tables. Outlays on transport equipment are also verified by the retail and wholesale-control method. Outlays on buildings are verified against the value of buildings completed as surveyed monthly by the Central Statistical Service.

3.2.3.4 Important categories of gross domestic fixed investment

- Investment in *private residential buildings* comprises the value put in place and major alterations and additions to permanent-site housing, including single-family housing units, duet housing units, townhouses, retirement units, flats and timesharing units in large cities, metropolitan areas, smaller cities and villages. This category is estimated from the results of the Central Statistical Service's monthly survey of buildings completed. Benchmarks are estimated from annual surveys by the Central Statistical Service. The cost of completion as submitted by the local authorities, is re-allocated to previous months to provide for the actual time when the values were put in place.

It is important to note that residential buildings completed by other economic sectors, for instance mining or the farming community, are shown as investment in residential buildings by that sector. Self-help schemes are included in this category, but outlays on materials for constructing squatter units are included in consumption expenditure.

- Estimates of capital expenditure by public utilities and public corporations are derived from quarterly and annual information which is obtained directly from the utilities and corporations.
- Capital expenditure by public authorities is obtained from an analysis of government finance

statistics. It is important, however, to note that the distinction made by government departments and agencies between current and capital expenditure is not accepted as such but is adjusted to conform with national accounting definitions and specifications.

- Information on capital expenditure financed by leasing contracts is obtained from financial institutions by the Reserve Bank. This capital expenditure is attributed to the sector "finance, insurance, real estate and business services."

3.2.3.5 Fixed investment at constant prices

The Reserve Bank compiles three separate price indices for the deflation of nominal expenditure on residential buildings, non-residential buildings and other construction works respectively. Incorporated in the indices are costs of materials, labour costs, overhead costs and profit margins. Expenditure on transport and other equipment is deflated by components of the production price index. Transfer costs are deflated by the price index for residential buildings.

3.2.4 Change in inventories

Stocks, or inventories, consist mainly of goods owned by producers that were purchased for intermediate consumption but are as yet unused, goods produced for sale that are still unsold, and work in progress. Government stocks of strategic products are also included, but the natural increase in agricultural crops is not included in stocks. Neither are new discoveries of mineral resources.

3.2.4.1 Valuation

The methods of inventory valuation used in business accounting (i.e. inventories at book value) vary and are often different from those required for the compilation of national accounts. For national accounts purposes the change in inventories should be calculated as the physical change in stocks during a given period valued at market prices prevailing at the time additions and withdrawals were made. In order to obtain the closest feasible approximation of the desired measure for national accounts, the difference between the physical levels of inventories at the beginning and at the end of a specific period, is valued at average prices ruling during that period.

Reported figures of stocks at the beginning and end of a quarter, i.e. the book values of inventories, are revalued to reflect constant price levels. The difference between the revalued figures for stocks at the end and the beginning of the quarter measures the physical change in stocks for that quarter. This physical change is again revalued at an average price for the quarter. The difference between the revalued changes in inventories and the changes in book values represents the "inventory valuation adjustment".

3.2.4.2 Principal sources and methods of calculation

As in the case of fixed investment, data on the value of stocks are obtained from various censuses and quarterly surveys.

When reevaluating inventories, the assumption is made that the FIFO (First in First Out) method of inventory accounting is most prevalent. To revalue stocks at average market prices, an estimate of the average stock turnover time is required. The ratio of stocks to flows serves this purpose.

3.2.4.3 Classification

Inventories are classified by type of economic activity and by type of organisation.

3.2.5 Imports and exports

Imports and exports are reclassified to comply with the requirements of the production account. Factor payments to the rest of the world (interest, dividends, royalties and compensation of employees paid to and received from the rest of the world) are not accounted for in the production account.

3.3 The deconsolidation of gross domestic income and production [GDP(I)] and [GDP(P)]

The gross domestic product can be calculated either by following the production approach or by following the cost approach. The production approach entails the calculation of the gross domestic product, [GDP(P)], as the difference between the value of the gross output of producers and the value of their intermediate consumption during a given period. The cost approach (or income approach) involves the summation of incomes accruing to production factors, i.e. compensation of employees, gross operating surplus and the excess of indirect taxes over subsidies, to arrive at the gross domestic product, [GDP(I)], at market prices.

Remuneration of employees covers gross salaries, wages and allowances of employees, whether in cash or in kind, including employers' contributions to holiday, pension, provident and medical funds, but before deducting employees' contributions to these funds and income taxes. Also included are remuneration in kind such as low-interest housing loans and motor cars. Gross operating surplus comprises gross output less intermediate consumption and remuneration of employees.

The accompanying example of a typical production statement of a firm illustrates how the gross domestic product can be calculated by means of the production and the cost or income approaches.

Estimates of the gross domestic product for various sectors of economic activity are obtained by either deducting intermediate consumption from gross output or adding together factor incomes generated by a particular economic sector. Two important adjustments have to be made, namely an

Production statement for the firm

R'000

Costs	Gross output
Goods and services purchased from other producers	Sales to Company A..... 700
Depreciation	Sales to Company B 330
Indirect tax	Sales to Company C..... 350

adjustment for financial service charges and an adjustment for indirect taxes net of subsidies. Both these adjustments are part of intermediate consumption, but it is difficult to assign them to any particular consuming unit, and therefore to allocate them to any particular sector of economic activity.

An adjustment for financial service charges has to be made because banks and other financial institutions generally receive interest for the services they render but these receipts are not considered to be a payment for the sale of services or production costs. If these institutions were treated like other establishments and their gross output measured as charges for services rendered, they would have had a negative value added because most of their income is generated by charging a higher rate of interest on advances made than their cost of funds. An imputation for the value of these services is therefore made and is shown as intermediate consumption of all producers as a group. The treatment of financial institutions is illustrated in the accompanying production statement of commercial banks.

An adjustment also has to be made for indirect taxes net of subsidies because the sectoral calcula-

tions of gross domestic product according to the production and cost approaches provide gross domestic product figures valued at factor cost and not at market prices.

In addition to the imputations for financial service charges, other imputations for certain specific economic sectors are also made for national accounting purposes. Whenever income is imputed, a corresponding expenditure item (intermediate or final) has to be recorded. Examples of such imputations are rent on owner occupied dwellings and farm produce for own consumption.

The statistical sources and methods of calculating the gross domestic product according to the production and cost approaches are summarised in Annexure B of this supplement. The production approach is followed to calculate the value added of agriculture, whereas the value added of the other sectors is based on the income or cost approach.

Constant-price estimates are obtained by extrapolating base-year calculations or interpolating between base years using changes in selected volume indices.

Gross domestic product estimates are also pre-

pared according to regions. The gross geographical product by magisterial district is currently estimated every third year by the Central Statistical Service. The most recent estimates are for 1984. Earlier estimates pertain to 1968, 1970, 1972, 1975, 1978 and 1981. Periodic censuses by the Central Statistical Service form the basis for estimating the gross geographical product. The gross geographical product does not represent an independent recalculation of the gross domestic product, but represents a breakdown of the gross domestic product estimates according to regions.

3.4 The input-output table

Among the constituent parts of the national product account, the input-output table occupies a central position. The input-output table serves as a means for achieving consistency and indicates statistical shortcomings which should be eliminated, but it also serves as an independent benchmark of the entire production account. Independent estimates of the components of the [GDP(I)], [GDP(P)] and [GDP(E)] for each industry are integrated into one set of tables. The South African input-output tables are compiled by the Central Statistical Service and published at approximately three-yearly intervals. To date the Central Statistical Service has published tables for the years 1967, 1971, 1975, 1978, 1981 and 1984.

4. National income and appropriation, capital finance and external accounts

In addition to the production account, three other important accounts are distinguished in the national accounts, namely: the national income and appropriation account; the capital finance or saving and investment account; and the external account.

4.1 National disposable income and its appropriation

The consolidated national disposable income and appropriation account is a consolidation of the income and outlay accounts of the institutional sectors of the domestic economy, namely the corporate account, the government account and the household account. These institutional sectors are the centres of decision-making on the acquisition and spending of income.

The net receipts by residents of incomes from employment, entrepreneurship and property, i.e. the gross national product (GNP), plus current transfers from abroad, make up the so-called national disposable income. The national disposable income represents the amount available for consumption expenditure (private and government) and saving.

4.1.1 Gross national product

The gross national product is a measure of income accruing as factor income to residents and is estimated at current and constant prices.

The gross national product at current prices is calculated as the gross domestic product at market prices less net distributed factor incomes to the rest of the world, in the form of net remuneration of employees and net other factor payments.

The real gross national product is calculated by: (a) subtracting from the real gross domestic product the net factor payments (i.e. remuneration of employees and receipts on capital investments) to the rest of the world, at constant prices; and (b) adding trading "gains or losses" which occur when there is a change in the so-called terms of trade.

4.1.2 Constituent accounts of national disposable income and appropriation

account consists of three institutional accounts, namely the corporate account, government account and the household account. The account for financial institutions is included in the corporate account and the account for unincorporated business enterprises as well as that for non-profit institutions serving households are included in the household account.

The first step in the deconsolidation of national income is to divide the value added generated in domestic production, net of consumption of fixed capital, between the institutional sectors of the economy. Remuneration of employees is allocated to the household sector and the net operating surplus is distributed among various institutional sectors (see Table 6). Cognisance is taken of transfer flows

between sectors. A part of these transfer flows between sectors is to compensate owners of financial assets for the deployment thereof in institutional sectors other than the one in which the owner is classified. A part is transferred without any associated quid pro quo.

4.1.3 Transfer of income from property between institutional sectors

Transfer of property income arises from the use of financial assets. It is not part of production costs and can be defined as the transfer of income resulting from the use by one economic agent of financial assets owned by another economic agent.

All the transfers of property income are estimated separately, except net interest and dividends received by households, which is derived as a balancing item.

4.1.4 Unrequited current transfers

Unrequited current transfers deal with transfers on current account, excluding indirect taxes and subsidies and are neither contractual nor quid pro quo in character. It is important to note here that the transfers in respect of life insurance and pension funds are not recorded in the income and outlay accounts.

Instead, these transactions are regarded as part of saving.

4.1.5 Corporate account

The corporate account are compiled for incorporated business enterprises by type of economic activity and separately for private enterprises and public corporations. Normally, the benchmark years were, to a large extent, obtained from the Central Statistical Service's census results of incorporated business enterprises. In-between years ("intercensal" years) and quarterly estimates are based on sample surveys of the income statements of business enterprises. Final estimates are verified against various other sources of information, such as data in respect of companies listed on the Johannesburg Stock Exchange.

4.1.6 Government account

The information contained in the government account is obtained from the set of government finance statistics (GFS).⁵ These statistics are compiled from data obtained from the various government institutions and from audited published reports. A separate account is constructed for each type of government organisation, for example:

- The main budget accounts of the Republic of South Africa;
- all extra-budgetary units and accounts, e.g. the Council for Scientific and Industrial Research, the South African Bureau of Standards, the Human Sciences Research Council, the South African Medical Research Council and the Council for Mineral Technology;
- central governments of independent and self-governing national states;
- provincial administrations;
- local authorities; and
- regional services councils.

4.1.7 Household account

The household account consists of all current transactions of households, non-profit institutions and unincorporated business enterprises. The household account is developed further in the social accounting matrices (SAMs). Two SAMs were developed for South Africa by the Central Economic Advisory Service (CEAS) for the year 1978. One focuses on within-household sector income distributions (the Income SAM), and the other provides an analysis of the regional distribution of personal income and certain other economic activities (the Regional SAM). The Central Statistical Service plans to publish the next SAMs during 1992.

⁵ A full description of the compilation of government finance statistics in South Africa is contained in a forthcoming publication of the Economics Department, titled *South Africa's public sector accounts*.

4.2 The capital finance account

The capital finance account of the system sets out the ways in which residents accumulate capital and the ways in which they finance this accumulation. Gross fixed capital formation and changes in inventories are the key ways of accumulation. Gross domestic saving (i.e net saving plus allowances for asset depreciation) is the dominant domestic source of finance. The other principal source of finance is net lending from the rest of the world.

4.2.1 Gross domestic saving

Gross domestic saving in the national accounts represents that part of gross national disposable income which is not disbursed as consumption expenditure (see Table 9). Saving is retained income resulting from the postponement of consumption. It is measured as a balancing item in the income and outlay accounts of the domestic institutional sectors, after current receipts and disbursements have been accounted for. Capital gains and losses are excluded from saving in the national accounts. Net domestic saving represents that part of gross domestic saving not provided by depreciation allowances.

The accounts of the corporate, government and household sectors are credited with their respective savings. Corporate saving is the retained income of private and public incorporated financial and non-financial enterprises. Saving by general government is the total of retained profits of public enterprises and retained taxes and other current receipts not disbursed on current outlays. Saving by households or personal saving, includes the retained income of unincorporated business enterprises, and retained income on the households' income and expenditure account as well as on the income and expenditure account of non-profit institutions serving households. All the income of pension funds is

attributed to households. Life insurance companies distribute only part of their net income to policy-holders, as interest added to equity of the policy-holders in the reserves of the insurance company, which forms part of personal saving.

4.2.2 Provision for depreciation and capital stock

The consumption of fixed capital may be defined in general terms as that part of the gross production which is required to replace fixed capital consumed in the process of production. This flow is based on the concept of the expected economic life of the individual asset and is designed to cover the loss in value due to foreseen ageing and normal wear and tear. Unforeseen losses, as in the case of a major natural or man-made disaster (e.g. war), are treated as capital losses rather than as fixed capital consumption. Charges for the depletion of exhaustible natural resources are not included in consumption of fixed capital.

Consumption of fixed capital is not provided for in the case of assets of general government services such as roads, dams and other forms of non-building constructions. In these instances, the outlay on repairs and maintenance is considered to be sufficient to maintain the asset indefinitely.

The consumption of fixed capital takes into account the cost of replacing the assets in the period for which the estimates are being made. Certain assumptions are made concerning the average economic life of the various assets. The assumed lifetimes vary from 80 years in the case of construction works in the agricultural sector, to eight years for transport equipment. Based on these assumptions, the provision for depreciation at constant prices is calculated by adopting the conventional "straight line method". The "perpetual inventory method" is used for the calculation of the real fixed capital stock.

Estimates of depreciation allowances and the capital stock at constant prices are converted to replacement values by multiplying the constant-price magnitudes with an appropriate price index.

4.3 The external account

The consolidated external account of the nation is a summary of all the transactions of resident economic agents with the rest of the world. For analytical purposes current and capital transactions are recorded separately.

5. Concluding remarks

The data contained in the accompanying statistical annexure are the official estimates of South Africa's national accounts. Along with the input-output tables, the estimates of regional gross domestic product, social accounting matrices and the national financial accounts, they present a reliable and com-

prehensive statistical overview of the South African economy and of its evolution over time.

The reliability of any estimated statistical series is only as good as the quality of the original data set from which it is derived and the validity of the assumptions on which it rests. The objectivity, professionalism and expertise of statisticians are also decisive for the quality of the resultant series. This is equally true for national accounts estimates. The compilation of South Africa's national accounts involves a continuous examining of official data sources, the development of new information sources, the utilisation of developments in the field of electronic data processing, the incorporation of the results of econometric and theoretical studies, and continuous adherence to specifications and definitions laid down in authoritative publications and manuals. For these reasons it can safely be claimed that the quality of the estimates of South Africa's national accounts compares favourably with that of any other country.

Statistical sources and methods of calculation*

1. Gross domestic product according to income method 1, 2

Sector	Subsector	Annual estimates	Quarterly estimates	Constant-price estimates
Agriculture, forestry and fishing	Agriculture	<p>Benchmark years: Quadrennial Census of Agriculture conducted by the CSS. GDP estimates compiled by the Department of Agriculture.</p> <p>Other years: An annual survey of agriculture conducted by the CSS. GDP estimates are compiled by the Department of Agriculture.</p> <p>Note: Estimates from the census and survey results are verified against quarterly source data collected by the Department of Agriculture. Estimates include the value of farm produce consumed by farmers for own account.</p>	Information obtained from the various agricultural control boards in respect of the value of production of field crops, horticulture and livestock. Expenditure on intermediate goods is collected by the Department of Agriculture from a number of manufacturers and associations, for <i>inter alia</i> , fertilisers, farm feed, dips and sprays, and packing material.	Nominal values of production and intermediate inputs are divided by appropriate price indices.
	Forestry	<p>Benchmark years and other years: Annual information obtained from the Department of Water and Forestry Affairs.</p>	Judgemental	Nominal values are divided by relevant components of the PPI.
	Fishing	<p>Benchmark years: Censuses of Fisheries.</p> <p>Other years: Information provided by the Marine Development Branch of the Department of Environment Affairs and technical periodicals.</p>	Same as for annual estimates for other years.	Base year estimates are extrapolated using appropriate indices of the quantity of fish caught.

* For footnotes and list of abbreviations used, see end of Annexure B

Sector	Subsector	Annual estimates	Quarterly estimates	Constant -price estimates
Mining and quarrying		<p>Benchmark years: Triennial Census of Mining conducted by the CSS.</p> <p>Other years: Working results of the Chamber of Mines in respect of the gold-mining industry and the quarterly survey of financial statistics and monthly labour statistics released by the CSS for the various sectors of the mining industry. Supplemented by sample surveys conducted by the S A Reserve Bank.</p>	Same as for annual estimates for other years.	Base year estimates are extrapolated using appropriate indices of output quantities of various sectors of mining. Information obtained from the Department of Mineral and Energy Affairs, the CSS and the Chamber of Mines.
Manufacturing		<p>Benchmark years: Triennial Census of Manufacturing conducted by the CSS.</p> <p>Other years: Quarterly surveys of financial statistics and monthly labour statistics released by the CSS, supplemented by sample surveys conducted by the S A Reserve Bank.</p>	Same as for annual estimates for other years.	Base year estimates are extrapolated using appropriate indices of output quantities of the various subsectors of manufacturing.
Electricity, gas and water		Benchmark and other years: Quarterly surveys conducted by the S A Reserve Bank, the CSS and annual statistics obtained from public authorities and public corporations.	Same as for annual estimates.	Base year estimates are extrapolated using appropriate indices of output quantities.
Construction		<p>Benchmark years: Triennial Census of Construction conducted by the CSS.</p> <p>Other years: Extrapolation of the base year estimates of gross operating surplus according to the trend in gross domestic fixed investment of residential and non-residential buildings and construction works as compiled by the S A Reserve Bank. Labour remuneration is extrapolated according to the monthly labour statistics of the CSS.</p>	Same as for annual estimates for other years.	Base year estimates are extrapolated using the trend in real gross domestic fixed investment of residential and non-residential buildings and construction works.

Sector	Subsector	Annual estimates	Quarterly estimates	Constant -price estimates
Wholesale and retail trade, catering and accommodation	Wholesale and retail trade (including motor trade)	<p>Benchmark years: Censuses of Wholesale Trade, Commercial Agents and Allied Services; Retail Trade; and Motor Trade and Repair Services.</p> <p>Other years: Quarterly surveys of financial statistics of wholesale, retail and motor trade and quarterly labour statistics released by the CSS, supplemented by sample surveys conducted by the S A Reserve Bank.</p>	Same as for annual estimates for other years.	Base year estimates are extrapolated using indices of wholesale, retail and motor sales quantities.
	Catering and accommodation	<p>Benchmark years: Censuses of Catering and Accommodation Services and the Census of Licensed Restaurants.</p> <p>Other years: Extrapolation according to the trend of retail trade sales and the income of registered hotels.</p>	Same as for annual estimates for other years.	Base year estimates are extrapolated using changes in real income of hotels.
	Enterprises of general government and agricultural control boards	<p>Benchmark years and other years: Audited annual reports obtained from local authorities, agricultural control boards and other institutions.</p>	Judgemental	Judgemental and verified against an index of employment numbers.
Transport, storage and communication		<p>Benchmark and other years: Financial reports of Transnet and the Department of Posts and Telecommunications and audited reports of business enterprises of general government. Private transportation benchmark estimates are obtained from Censuses of Transport and Allied Services. Estimates for in-between years of value added by private transport are extrapolated according to the quarterly surveys of financial statistics of public road transport (non-governmental institutions) of passengers and goods.</p>	Same as for annual estimates obtained quarterly from the various institutions.	Base year estimates are extrapolated using appropriate indices of the volume of services rendered by the various institutions.

Sector	Subsector	Annual estimates	Quarterly estimates	Constant-price estimates
Finance, insurance, real estate and business services	Finance and insurance	Benchmark and other years: Annual and quarterly surveys conducted by the S A Reserve Bank among the various institutions in the private sector and information reported by public authorities and public corporations.	Same as for annual estimates.	Base year estimates are extrapolated using appropriate indices, verified by nominal transactions divided by appropriate price indices.
	Real estate (including imputed rent on residential buildings) and business services	Benchmark and other years: Censuses of Business Services, annual survey of houses, sectional title units and domestic workers and the annual survey of flats.	The quarterly surveys by CSS of buildings completed and price indices of rent.	Base year estimates are extrapolated using an index of the estimated number of houses.
	Community, social and personal services	Benchmark and other years: Censuses of Social Services.	Judgemental	Nominal values divided by relevant components of the CPI.
	General government	Benchmark years: GFS analyses. Other years: Main Budget and annual reports of the provincial and local authorities and extra-budgetary accounts, including the TBVC countries and the self-governing national states. (The gross operating surplus reflects the imputed rent on government buildings as derived from the calculation of provision for depreciation at replacement value for such buildings.)	Quarterly surveys by the CSS of employment, salaries and wages in the public sector. Gross operating surplus equals provision for depreciation allowances at replacement values.	Base year estimates are extrapolated using an index of employment by general government.

Sector	Subsector	Annual estimates	Quarterly estimates	Constant-price estimates
Other producers		Benchmark and other years: Censuses of relevant social services, (such as welfare organisations), supplemented by annual reports of relevant non-profit institutions. Remuneration of domestic servants is obtained from the annual survey of houses, sectional units and domestic workers.	Judgemental. (Remuneration of domestic servants are extrapolated using the number of residential buildings completed.)	Nominal values are divided by relevant components of the CPI and verified by the GDP deflator.

2. Gross domestic expenditure ^{2, 3}

Sector	Subsector	Annual estimates	Quarterly estimates	Constant-price estimates
Private consumption expenditure	Durable and non-durable goods: Most goods (except sub-components listed separately)	Benchmark years: Quinquennial surveys of household expenditure conducted by the CSS, BMR at Unisa and HSRC. Estimates of main aggregates are compiled by the SA Reserve Bank using the average expenditure per household multiplied by the number of households according to population census statistics. Other years: Annual information obtained from the CSS.	Base year estimates are extrapolated using retail sales from monthly surveys by the CSS and the Retailer Liaison Committee.	Nominal expenditure are divided by relevant components of the CPI. or Base year estimates are extrapolated using quantities purchased. (Deflators verified against the relevant CPI components.)
	Personal transport equipment: New motor cars and mini-busses	Benchmark and other years: Annual information on motor vehicles sold, verified by registrations of new motor cars.	Same as for annual estimates.	Base year estimates are extrapolated using appropriate indices of motor vehicles registered.
	Used cars	Benchmark and other years: Value added by used-car trade estimated for GDP; verified by registrations of used cars and trade margins provided by motor trade.	Same as for annual estimates.	Nominal values are divided by relevant components of the CPI.

Sector	Subsector	Annual estimates	Quarterly estimates	Constant-price estimates
Private consumption expenditure (continued)	<p>Food, beverages and tobacco: All components</p> <p>Petroleum products: Petrol, diesel and oil</p> <p>Services: Rent: space rent for owner-occupied and rent for tenant-occupied dwellings</p> <p>Domestic services</p> <p>Physicians, dentists, and other medical professional services</p>	<p>Benchmark years: Estimated by the Department of Agriculture; verified by the quinquennial survey of household expenditure, surveys of retail sales and the input-output data. Estimates include farm produce consumed by farmers for own account.</p> <p>Other years: Department of Agriculture verified by surveys of retail sales.</p> <p>Benchmark and other years: Quantities purchased multiplied by average retail price. Verified by the quinquennial survey of household expenditure and input-output estimates.</p> <p>Benchmark years: Population censuses and average annual rental obtained from CSS's annual survey of houses, sectional units and domestic workers</p> <p>Other years: Capital stock of residential buildings and average annual rental values.</p> <p>Benchmark and other years: Remuneration and weekly hours are multiplied by the number of workers using CSS's annual survey of houses, sectional units and domestic workers.</p> <p>Benchmark years: From CSS's censuses of medical practitioners and hospitals. Verified by the quinquennial survey of household expenditure and input-output estimates.</p> <p>Other years: Various indicators; population growth and data obtained from provincial hospitals.</p>	Same as for annual estimates. Same as for annual estimates. Same method as annual; housing stock extrapolated by residential capital stock and average rental values. Judgemental Same as for annual estimates.	Nominal expenditure divided by relevant components of the CPI. Base year estimates are extrapolated using physical quantities purchased. (Deflator verified by the CPI component.) Base year estimates are extrapolated using real capital stock of residential buildings. Base year estimates are extrapolated using number of workers and weekly hours. (Deflator verified by the appropriate CPI component.) Nominal expenditure divided by CPI of medical and hospital services.

Sector	Subsector	Annual estimates	Quarterly estimates	Constant-price estimates
Private consumption expenditure (continued)	Services: (continued) Transport and communication.	<p>Benchmark years: Expenditure on passenger and goods transport obtained from Transnet; expenditure on telephones, postage and other postal services supplied by the Department of Posts and Telecommunications; censuses of taxis and private transport services; expenditure on insurance from short-term insurers, and the censuses of local authorities. Verified by the quinquennial surveys of household expenditure and input-output estimates.</p> <p>Other years: Base year estimates are extrapolated by using information from Transnet, the Department of Posts and Telecommunications, short-term insurers and judgemental trend on taxis.</p>	Same as for annual estimates.	Base year estimates are extrapolated by using an index of number of passengers, the number of telephone calls and judgement on taxis and other transport. (Deflator verified by relevant CPI components.)
	Entertainment, cultural and educational services.	<p>Benchmark years: Entertainment and recreational services: Expenditure on admission fees to theatres, cinemas, sports events, museums, etc. obtained from miscellaneous publications and other sources of information. Verified and supplemented by the quinquennial survey of household expenditure, for <i>inter alia</i>, hiring of television sets, videos and other recreational equipment, film development and photographic services and veterinary and other services for pets. Television licences paid annually, obtained from SABC and the Department of Posts and Telecommunications. Education: Fees to schools, universities, etc. from published information.</p> <p>Other years: Base year estimates are extrapolated using GDP estimates and available quarterly data of certain services.</p>	Various indicators, and information obtained from the Department of Education, the SABC and the Department of Posts and Telecommunications, as well as judgement.	Nominal expenditure is divided by relevant components of the CPI.
	Miscellaneous services: Restaurants, cafés, hotels and lodging	<p>Benchmark years: Quinquennial survey of household expenditure.</p> <p>Other years: Adding of quarterly estimates.</p>	Extrapolation of benchmark figures with information obtained from a sample survey of hoteliers, published by the CSS in <i>Statistics of Registered Hotels</i> .	Nominal expenditure is divided by relevant components of the CPI and extrapolation using the number of room nights sold at registered hotels.
	Personal care services by barber, beauty shops ,etc.	<p>Benchmark years: Quinquennial survey of household expenditure</p> <p>Other years: Adding of quarterly estimates.</p>	Judgement; verified by growth in population.	Nominal expenditure is divided by the CPI for hairdressing services.

Sector	Subsector	Annual estimates	Quarterly estimates	Constant-price estimates
Private consumption expenditure (continued)	Miscellaneous services: (continued)			
	Financial services	<p>Benchmark years: Quinquennial survey of household expenditure.</p> <p>Other years: Adding of quarterly figures.</p>	Judgement verified by relevant economic indicators.	Nominal expenditure is divided by CPI for services.
	Other services	<p>Benchmark years: Quinquennial survey of household expenditure.</p> <p>Other years: Adding of quarterly figures.</p>	Same as estimates for financial services.	Nominal expenditure is divided by CPI for services.
	Consumption expenditure by non-residents in domestic market	Balance of payments data regarding travelling costs, tourist expenditure and remuneration of contract workers.	Same as for annual estimates.	Nominal expenditure is divided by the CPI.
	Direct purchases of resident households abroad	Balance of payments data regarding expenditure of resident households abroad.	Same as for annual estimates	Nominal expenditure is divided by a weighted average of CPI price indices of South Africa's major trading partners.
Consumption expenditure by general government.	Expenditure on intermediate goods and services	<p>Benchmark years: GFS analyses.</p> <p>Other years: GFS analyses and information on the general government received from the CSS.</p>	Extrapolated by using information obtained from the Financial Management System (FMS) of the General Government and exchequer issues obtained from the Department of Finance.	Nominal values are divided by a weighted average of relevant components of the PPI.

Sector	Subsector	Annual estimates	Quarterly estimates	Constant-price estimates
Consumption expenditure by general government (continued)	Compensation of employees	Same as for intermediate goods and services.	Extrapolated by using information obtained from the Financial Management System of the General Government received from the Department of Finance and quarterly surveys received from CSS.	Base year estimates extrapolated according to employment data obtained from CSS for central government, local authorities, provincial administrations, statutory bodies and national and independent states.
	Consumption of fixed capital	Allowances for depreciation of general government's buildings estimated by the S A Reserve Bank.	Same as for annual estimates.	Allowance for depreciation of the real value of fixed capital stock.
	Sales of government services	Same as for intermediate goods and services.	Extrapolated by using information obtained from the Financial Management System of the General Government received from the Department of Finance.	Nominal values are divided by a derived price deflator of intermediate inputs.

Sector	Subsector	Annual estimates	Quarterly estimates	Constant-price estimates
Gross domestic fixed investment	Private sector: Most fixed investment (except subcomponents listed separately)	<p>Benchmark years: Quinquennial censuses conducted by the CSS for the various sectors of the economy.</p> <p>Other years: Extrapolated or interpolated according to the results of quarterly sample surveys by the S A Reserve Bank and the CSS of financial statistics of business enterprises. Verified by input-output estimates.</p>	Extrapolated by using information from quarterly sample surveys of the CSS; SA Reserve Bank surveys; and information collected by the Department of Agriculture; and judgemental projections based on relevant time series.	Nominal values of fixed investment by type of assets are divided by appropriate price indices. Residential, non-residential and construction works are divided by separate weighted indices, compiled by the S A Reserve Bank. Transport equipment and machinery and other equipment are divided by weighted indices of relevant components of the production price index. Investment in agriculture is divided by weighted price indices obtained from relevant time series supplied by the Department of Agriculture.

Sector	Subsector	Annual estimates	Quarterly estimates	Constant-price estimates
Gross domestic fixed investment (continued)	Transfer costs	The sum of quarterly estimates of the transfer fees paid to general government, plus the agent and legal fees calculated as a percentage of the value of transactions in real estate.	Same as for annual estimates.	Nominal values are divided by the price index for residential buildings.
	Public corporations	Annual surveys of the corporations conducted by the S A Reserve Bank.	Same as for annual estimates.	Same as for private sector.
	Public authorities	Information obtained from GFS analyses.	Same as for annual estimates.	Same as for private sector.
Change in inventories.	Industrial and commercial inventories and other non-farm industries	Benchmark years: Book value of inventories (adjusted by inventory revaluation) obtained from the censuses of the CSS and surveys by the S A Reserve Bank among public corporations and business enterprises of general government. Other years: CSS and S A Reserve Bank quarterly surveys. Livestock and gold require no valuation adjustment ; changes are calculated from physical quantities and average current prices.	Same as for annual estimates; based on information obtained from quarterly financial surveys conducted by the CSS and the S A Reserve Bank.	Book value of inventories is divided by the production price index, or specific price indices, such as for diamond stocks-in-trade.
	Agricultural stocks-in-trade	Quarterly statistics from the various Agricultural Control Boards.	Same as for annual estimates.	Base year values are extrapolated by using the quarterly change in physical quantities.

¹ Except for agriculture, where the production approach is applied. When the latter method is used the GDP is estimated as the difference between the values of production and outlays on intermediate goods. When the income method is used a distinction is made between remuneration of employees and gross operating surplus.

² Annual and quarterly estimates are extended to incorporate the self-governing national states and the TBVC countries.

1. Lopende besteding aan salarisse en lone en aan goedere en ander dienste van nie-kapitale aard van die algemene afdelings, maar nie die sakeondernemings nie, van openbare overhede. Openbare overhede sluit in sentrale overhede, provinsiale administrasies en plaaslike overhede van die gedefinieerde gebied en buitebegrotingsfondse.

2. Na aansuiwing ten opsigte van voorraadwaardering.

1. Current expenditure on salaries and wages and on goods and other services of a non-capital nature of the general departments, but not the business enterprises, of public authorities. Public authorities include central authorities, provincial administrations and local authorities of the defined territory and extra-budgetary funds.

2. After inventory valuation adjustment.

1. Lopende besteding aan salarisse en lone en aan goedere en ander dienste van nie-kapitale aard van die algemene afdeling, maar nie die sakeondernemings nie, van openbare owerhede. Openbare owerhede sluit in sentrale owerhede, provinsiale administrasies en plaaslike owerhede van die gedefinieerde gebied en buite-begrotingsfondse.

1. Current expenditure on salaries and wages and on goods and other services of a non-capital nature of the general departments, but not the business enterprises, of public authorities. Public authorities include central authorities, provincial administrations and local authorities of the defined territory and extra-budgetary funds.

1. Lopende besteding aan salarisse en lone en aan goedere en ander dienste van nie-kapitale aard van die algemene afdelings, maar nie die sakeondernemings nie, van openbare owerhede. Openbare owerhede sluit in sentrale owerhede, provinsiale administrasies en plaaslike owerhede van die gedefinieerde gebied en buitebegrotingsfondse.

1. Current expenditure on salaries and wages and on goods and other services of a non-capital nature of the general departments, but not the business enterprises, of public authorities. Public authorities include central authorities, provincial administrations and local authorities of the defined territory and extra-budgetary funds.

- Die gevewens in hierdie tabel het betrekking op private huishoudings (insluitende pensioen- en voorsorgfondse en langtermynversekeringsfondse) en private nie-winnende instellings (bv. kerke, welsyngorganisasies en sportklubs) wat sosiale en gemeenskapsdienste aan huishoudings lewer.
- Ná aansuiwing vir netto vergoeding aan buitelanders betaal.
- Inkome uit eiendom bestaan uit dividendontvangste; rente-ontvangste verminder met rentebetelings; huurontvangste verminder met instandhoudingskoste, verbandende en voorstelling vir waardevermindering; en die winste, verminder met verlies, van nie-geïnkorporeerde sakeondernemings na voorsiening vir waardevermindering en ná aansuiwing ten opsigte van voorraadwaardering.
- Ná voorsiening vir waardevermindering en ná aansuiwing t.o.v. voorraadwaardering.

- The data in this table refer to private households (including pension and provident funds and long-term insurance funds) and private non-profit institutions (e.g. churches, welfare organisations and sports clubs) that render social and community services to households.
- After adjustment for net remuneration paid to the rest of the world.
- Income from property consists of dividend receipts; interest receipts less interest payments; rent receipts less maintenance cost, mortgage interest and provision for depreciation; and the profits of non-corporate business enterprises after provision for depreciation and after inventory valuation adjustment.
- After provision for depreciation and after inventory valuation adjustment.

- Die gevewens in hierdie tabel het betrekking op private huishoudings (insluitende pensioen- en voorsorgondse en langtermynversekeringsfondse) en private nie-winsokkende instellings (bv. kerke, weisensorganisasies en sportklubs) wat sosiale en gemeenskapsdienste aan huishoudings lever.
- Ná aansuiwing vir netto vergoeding aan buitelanders betaal.
- Inkome uit eiendom bestaan uit dividendontvangste; rente-ontvangste verminder met rentebetettings; huurontvangste verminder met instandhoudingskoste, verbandrente en voorseening vir waardevermindering; en die winste, verminder met verliese, van nie-gein-korporerde sakeondernemings na voorseening vir waardevermindering en ná aansuiwing ten opsigte van voorraadwaardering.
- Ná voorseening vir waardevermindering en ná aansuiwing t.o.v. voorraadwaardering.

- The data in this table refer to private households (including pension and provident funds and long-term insurance funds) and private non-profit institutions (e.g. churches, welfare organisations and sports clubs) that render social and community services to households.
- After adjustment for net remuneration paid to the rest of the world.
- Income from property consists of dividend receipts; interest receipts less interest payments; rent receipts less maintenance cost, mortgage interest and provision for depreciation; and the profits of non-corporate business enterprises after provision for depreciation and after inventory valuation adjustment.
- After provision for depreciation and after inventory valuation adjustment.

- Die gegewens in hierdie tabel het betrekking op private huishoudings (insluitende pensioen- en voorzorgfondse en langermyversekeringsfondse) en private nie-winsaekskeende instellings (bv. kerke, welsynsorganisasies en sportklubs) wat sosiale en gemeenskapsdienste aan huishoudings lewer.
- Ná aansuiwing vir netto vergoeding aan buitelanders betaal.
- Inkome uit eiendom bestaan uit dividendontvangste; rente-ontvangste verminder met rentebetettings; huurontvangste met instandhoudingskoste, verbandrente en voorsting vir waardevermindering; en die winste, verminder met verhese, van nie-geïnkorporeerde sakeondernemings na voorsting vir waardevermindering en ná aansuiwing ten opsigte van voorraadwaardering.
- Ná voorsiening vir waardevermindering en ná aansuiwing t.o.v. voorraadwaardering.

- The data in this table refer to private households (including pension and provident funds and long-term insurance funds) and private non-profit institutions (e.g. churches, welfare organisations and sports clubs) that render social and community services to households.
- After adjustment for net remuneration paid to the rest of the world.
- Income from property consists of dividend receipts; interest receipts less interest payments; rent receipts less maintenance cost, mortgage interest and provision for depreciation; and the profits of non-corporate business enterprises after provision for depreciation and after inventory valuation adjustment.
- After provision for depreciation and after inventory valuation adjustment.

1. Inkome uit eiendom van algemene owerheid bestaan uit rente-, dividend- en huurontvangste van die algemene owerheid en die winsie van owerheidsakeondernemings.

2. Ná voorstiening vir waardevermindering en ná aansuiwing ten opsigte van voorraadwaardering.

3. Lopende besteding aan salarisse en lone en aan goedere en ander dienste van nie-kapitale aard van die algemene afdelings, maar nie die sakeondernemings nie, van openbare owerhede. Openbare owerhede sluit in sentrale owerhede, provinsiale administrasies en plaaslike owerhede van die gedefinieerde gebied en buitebegrotingsfondse.

1. Income from property by general government consists of interest, dividend and rent receipts by general government and the profits of public business enterprises.

2. After provision for depreciation and after inventory valuation adjustment.

3. Current expenditure on salaries and wages and on goods and other services of a non-capital nature of the general departments, but not the business enterprises, of public authorities. Public authorities include central, provincial, administrative and local authorities of the defined territory and extra-budgetary funds.
